

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

*Report on the Transit Trade between the City of Erzeroom
and Persia.*

M. Maguck to Mr. Stuart.

Monsieur, Erzeroom, le 16 Juin, 1865.

J'AI l'honneur d'envoyer ci-joint les renseignements sur le transit de la Perse et sur les transactions de ce pays avec Erzeroom en duplicata.

Il a été constaté par le compte rendu qu'un déficit en affaire de 30 pour cent entre 1863 et 1864, l'importation de l'Europe sur la place d'Erzeroom inclusive-ment; par contre un excédant d'affaire a substitué comparativement à plusieurs articles.

La quantité des soies exportée de la Perse diminue depuis six ans sensiblement, et d'après les renseignements puisés de bonnes sources, la maladie des vers se serait propagée dans plusieurs districts de la province de Resht.

Les dernières nouvelles reçues de la Perse signalent la prévoyance d'une récolte encore inférieure à celle de l'année passée,

Les places de Londres et de Marseilles, où le commerce des soies est concentré, se ressentiront bientôt

de la rareté de l'article, surtout quand la consommation faite sur les lieux de production devient de jour en jour plus importante par la fabrication des différents tissus qui trouvent déjà un débouché sur quelques places de l'Empire Ottoman et même dans sa capitale.

Les Persans ont réussi toute dernièrement à fabriquer aussi du velours soie qui rapproche de beaucoup celui de Gènes à l'usage du Levant.

Le transport des marchandises de Trébizonde à Erzeroum commence à présenter de nouvelles difficultés.

Le nombre des chevaux et mulets de charge diminue graduellement, surtout depuis quelques années que les prix des fourrages ont doublé à la suite de mauvaises récoltes.

La population d'Erzeroum a énormément souffert des conséquences, et la disette qui menaçait le Kaimaclick de Mouche se serait sans doute déclarée si le Pachalik de Diarbékirk ne lui était venu en aide à temps.

La mauvaise administration du pays, et surtout celle des Mudirs depuis la dernière guerre, l'emprunt forcé de 1861, l'épizootie de 1863, et les nouvelles contributions sur les bestiaux, sur le sel, et le tabac, ont réduit les habitants à un état de complète misère.

Il y a à ajouter à ces circonstances fâcheuses la conduite peu honnête des dîmiers, en général Arméniens, et qui sont malheureusement très souvent secondés dans leurs actes cruels par les autorités civiles.

Le villageois qui possédait autrefois des terres, des maisons, des bestiaux, et souvent des chevaux de selle, n'est aujourd'hui qu'un simple ouvrier de quelque usurier chez lequel des circonstances l'avait forcé de contracter des dettes.

Loin de me prononcer contre le nombre des contributions qui forment une bonne partie des recettes de l'Empire Ottoman, mon intention est seulement de faire observer qu'avec une pareille administration cet état de choses ne pourrait guère continuer. Déjà le Gouvernement s'en ressent lui-même par les sommes notables qui lui sont dues à titre d'arriéré.

■ ■ Si jamais on soumettait cette question arriérée à l'examen des hommes de conscience pure, on constatera la présence de plusieurs abus commis au détriment de

la population par les percepteurs d'impôts, comme aussi on sera convaincu qu'une grande partie des sommes figurées dans les registres de l'Ayalet comme arriérées ont été à temps dûment payées par les populations.

Pour remédier à cet état déplorable et surtout pour protéger le commerce Européen, il y a des moyens qu'on serait encore à temps d'employer. C'est avant tout la construction de la route de Trébizonde à la frontière projetée depuis si longtemps, la création d'une banque à l'effet d'aider l'agriculture et d'avancer en même temps les fonds nécessaires (il n'en faut pas beaucoup) pour l'exploitation de quelques mines de charbon et de fer, dont deux excessivement riches; l'introduction d'un nouveau système d'administration dans la perception des impôts. Ceci à l'effet de mettre un frein aux abus des petits fonctionnaires.

Toutefois ce système ne pourrait étendre le chiffre des dépenses de l'administration actuelle.

Ces trois moyens employés, il n'y a pas de doute, comme aussi d'après un calcul fait, la population de cette province pourra, en moins de six ans, occuper un certain rang dans l'agriculture et le commerce.

J'ai, &c.

(Signé)

A. MAGACK.

Netherlands.

*Report by Mr. Ward, Her Majesty's Secretary of Legation,
on Reforms in Taxation in the Netherlands.*

The Hague, June 15, 1865.

IN my last Report I had occasion to mention the reduction of taxation on fuel, by the entire repeal of the Government duty on coal and turf: the Minister of Finance is now proceeding to carry out other measures of reform of taxation, and a series of Bills is before the Chambers in different stages of advancement, which, if accepted, will redeem the engagement taken upon himself by M. Betz on entering office.

The first of these is in connection with the Treaty concluded in November last between Belgium, France, Great Britain, and the Netherlands, on the sugar question, the provisions of which have now received the constitutional sanction of the Legislature of this country, and a law has been prepared and passed in conformity with it, regulating the amount of excise and drawback, and the manner of carrying on the business of sugar refining.

Instead of a uniform excise upon all raw sugar of 22 florins per 100 kilogrammes, they will hereafter be taxed in the proportions named in the schedules contained in Article 2 of the Law, of which a translation is annexed to this Report, until the IIIrd Article of the Treaty of the 6th November, 1864, shall come into operation.

Under the existing system the refiner was debited with the amount of duty on the raw sugar imported or purchased by him, a certain term of credit being allowed to him according to his entries, namely, for an annual entry of 1,110,000 kilogrammes five months, and for all excess above this quantity two months. He was then permitted to set off against the amount due by him the value of the refined sugar exported or bonded by him at the rate of 26 florins 86 cents per 100 kilogrammes. This is equivalent to a turn-out of

81 $\frac{2}{10}$ ths refined for each 100 kilogrammes of raw sugar; but in order to prevent the absorption of the whole revenue from the excise on sugar by the drawbacks, it was further enacted that the refiner should pay 5 per cent. of the duty in cash, and that if during any half-year the amount of revenue should fall short of 1,000,000 florins, the deficiency should be assessed proportionately upon the outstanding accounts of the refiners.

The effect of this enactment has been to keep the amount of revenue from the article stationary at the minimum, and at the same time to limit the amount refined. For, as the quantity of refined turned out from a given quantity of raw sugar has, by the improvements introduced in the process, come to exceed very much the proportion above-mentioned, and as the whole demand of the country can be fully supplied by the excess, it does not pay the refiner to produce more than will enable him to supply the home market, in which alone he can obtain the duty payable to the Government over and above the export price of his goods. On the other hand, as the sugar supplied by the refiners for the consumption of the country has virtually been produced by them free of duty, it is obvious that no competition with them is practicable. Under the new rates now fixed by law, the refiners will no longer have the same command of the home market, unless the foreign demand should increase in a greater proportion, so that a much larger amount of the excise would fall to the share of the Government.

The Minister of Finance has furnished the following Table showing the imports and exports of raw sugar, and the quantity of beet-root sugar manufactured in the country during the last four years, together with the quantities of refined and other manufactured sugars exported, to which he has attached a calculation showing how, under the new system of taxation, a revenue of 3,500,000 florins may reasonably be expected:—

STATEMENT showing the Import, the Home Production, and the Export of Sugar during the last Four Years.

Years.	Raw Sugar remaining in the Country.					Export of Refined Sugar and Bastards.		
	Imports for Consumption.	Production by Beetroot Factories.	Total of the two preceding Columns.	Sugar Exported out of the Country.	Remaining in the Country.	Candy.	Leaves and Lumps.	Bastards.
1861	Kilos. 86,730,412	Kilos. 886,597	Kilos. 86,617,009	Kilos. 227,941	Kilos. 86,889,088	Kilos. 831,408	Kilos. 63,173,818	Kilos. 18,317
1862	86,761,747	1,370,648	87,132,390	880,876	86,761,514	1,116,330	62,565,042	49,917
1863	91,152,370	2,983,317	94,143,687	1,540,604	92,608,083	1,061,187	62,461,471	819,794
1864	98,600,689	3,280,138	96,890,827	1,494,838	95,455,989	888,806	67,320,725	385,606
Total for the four years ..	355,245,218	8,543,686	364,788,913	3,594,259	361,204,654	3,877,716	255,541,056	1,278,634
Average per year ..	88,061,304	2,135,924	91,197,228	896,065	90,301,163	969,439	63,886,264	318,408

He has also laid before the Second Chamber other Tables having for their object to prove that on the hypothesis of a turn-out of 91 per cent., being 5 per cent. more than the average assumed under the new law, by the operation of the sliding scale enacted in Article B, the revenue could never fall below the expected amount, nay, that it would considerably exceed it. Upon these calculations he grounded his decision to relinquish the principle of a minimum of revenue as before described. The Second Chamber has, however, re-introduced it into the law, with some modifications, with a view of securing to the Exchequer the estimated increase of revenue. It will probably have no other effect than that of quieting the apprehensions of those who might anticipate a falling off in the receipts.

Two other points may be briefly referred to which suggest themselves with respect to the legislation on sugar in a fiscal point of view. First, the reduction of the rate of duty. The answer to the claims for this reduction is, in this as in most other countries, that the amount of revenue derived from it cannot be dispensed with. And in connection with the other measures now in progress in the Netherlands, it will be seen how indispensable it is for the purpose of covering the deficiency anticipated from the result of those measures.

Secondly, the idea of refining in bond. This idea the Minister set aside at once, on the authority of the experience of it acquired in England, and his decision appears to have been accepted as satisfactory.

A more important measure than the foregoing has recently received the sanction of the Second Chamber, the principle of which is to abolish all local taxation upon articles of consumption.

In the Communal Law of 1851, the communes were empowered to levy, with certain limitations and restrictions, and either in the form of per-centages upon Government, taxes on consumption, or by special assessment on different articles, a portion of the amount of revenue necessary to enable them to meet the expenditure imposed upon them by law. There are at present only 211 communes where no taxes on consumption are raised. In the remainder the direct

and indirect taxation is in different proportions, according to local circumstances or the reasons of expediency which recommend themselves to the different Communal Councils. It is necessary now to replace taxation of the latter description by other resources, which the measure in question proposes to do by ceding to the communes four-fifths of the personal taxes levied by the State, by abolishing the 21½ per cent. on the principal sum of the land tax, heretofore paid by the Government, and by empowering them to raise the following taxes :—

Per-centages on the principal sum of the State land tax, to the extent of 40 per cent. on houses and buildings, and 10 per cent. on land ;*

Per-centages on the personal and other taxes levied by the State in proportion directly to the means and income of the taxpayer, with the exception of the "patent regt ;"*

"Hoofdelijke omslagen," or other direct local taxes ;*

Tax upon dogs ;

Tax on places of public amusement ;

Dues and charges for the user of the public property of the commune.

No per-centage on the principal sum of the personal taxes can be levied until the per-centages on that of the land tax have been raised to their maximum, and a "hoofdelijke omslag," or other direct tax, has been assessed to an amount at least equal to that of the per-centages intended to be imposed upon personal taxation.

It is manifest that the 211 communes above alluded to will receive a very considerable boon by the law as thus explained, since they may supply the whole or part of the direct taxation to which they have been hitherto subject for local purposes out of the 80 per cent. of the personal tax ceded to them, while they will be relieved from the payment to the State of 21½ per cent. on the principal sum of the land tax.

Of the remaining communes, according to the Returns laid before the Chambers by the Government, there are 773 where the net amount of the taxes on

* The nature of these taxes is explained in my Report of the June 29, 1861, at pp. 137 and 144.

consumption is less than that of the direct taxation ceded or abolished by the State. In these, accordingly, the measures may be easily carried out.

There remain 152 communes in which the abolition of the taxes on consumption will call for an increase of direct taxation on the inhabitants. In 20 of these the 18½ per cent. on the principal sum of the land tax on buildings, which together with the 21½ per cent. hitherto levied by the State, but now abolished, make up the 40 per cent. allowed for communal purposes under this head, will enable them to balance their expenditure; so that in 132 only will it be necessary to have recourse to the "hoofdelijke omslagen" and other direct taxes, together with the per-centage on the principal sum of the personal tax. These 132 include all the large towns with the exception of Rotterdam, Arnhem, Haarlem, Utrecht and Groningen.

I subjoin a Table with reference to the principal of these, namely, those having a population exceeding 10,000:—

Name.	Population.	Net amount of Taxes on Consumption.	State Taxes Ceded or Abolished.	Direct Taxes levied under the present Law.
		Florins.	Florins.	Florins.
Amsterdam	260,621	1,295,745	1,026,497	1,023,444
The Hague	81,393	642,893	450,970	134,882
Leiden	36,274	165,945	101,005	81,877
Maastricht	27,658	186,810	71,810	20,865
Leeuwarden	23,937	111,651	74,218	86,526
Bois-le-Duc	23,858	81,890	67,629	21,208
Nijmegen	21,468	70,566	57,410	18,152
Delft	21,019	108,330	57,455	25,949
Middelburg	16,259	116,051	60,864	41,149
Schiedam	15,406	77,400	47,026	45,857
Gonda	15,321	63,258	30,320	9,117
Breda	15,069	46,765	41,049	27,871
Helder	14,751	96,326	29,747	10,932
Amersfoort	12,699	33,220	24,558	28,203
Zaandam	11,968	57,150	22,699	20,344
Vlissingen	11,520	86,441	23,155	6,870
Harlingen	10,042	38,215	21,708	16,599

Examining the accounts of the Hague, as a specimen of communal finance, that part of the income which will be affected by the new law is found to be raised in the following proportions, according to the Estimates of 1865:—

Direct Taxes, to wit—			Florins.	Florins.
15 per cent. on the principal sum of the land tax on buildings	32,500
10 per cent. on land	1,000
Per-centages on the principal sum of the personal tax	102,300
				<hr/> 135,800
Taxes on Consumption—				
Butcher's meat	107,400
Spirits	189,700
Flour and meal	228,000
Wine	47,000
Turf	44,800
Coals	64,200
Firewood	15,200
				<hr/> 692,100
Tolls and other charges paid for the user of the property of the commune	61,643
Other taxes not included in the above	600
				<hr/> 890,143

Now the largest portion of this will henceforth have to be furnished from other sources, two of which are indicated by the law, namely :—

	Florins.
Per-centage on the land tax on buildings (15 per cent. is the proportion now raised, therefore there is only 25 per cent. now disposable, i.e., on a principal sum of 216,996 florins 89 cents 54,244
Four-fifths of the personal tax ceded by the State, i.e., of 421,164 florins 50 cents 336,931

These figures are taken from the Estimates published by the Commune, but they differ from those in the Tables laid before the Chambers by the Government; for instance, the last item in the latter is 404,316 florins.

There will therefore remain a considerable deficit to be provided for, and the law defines within narrow limits the manner of doing this in its 8th Article, which prohibits a resort to the resource of per-centages on the personal tax, until an "hoofdelijke omslag," or other direct tax, shall have been raised, equal, at least, to the amount of the per-centage intended to be taken on the personal tax.

Under the present system, no direct taxes such as those last alluded to are levied in the Hague. As, however, the evidences of rapidly increasing prosperity cannot fail to strike every one who has observed the Hague during the last few years, it is not reason-

ably to be supposed that there will be any considerable difficulty in so re-adjusting the finances of the Commune as to meet all its indispensable expenditure.

Other communes, however, may not be so favourably circumstanced, and therefore it is provided that special laws shall be presented to the Legislature before the 1st of January next, indicating the Communes on behalf of which exceptions from the prohibition to raise taxes on consumption shall be permitted; and it is finally enacted that all local taxes, with the exception of dues and charges for the user of the public property of the Communes, shall be revised and submitted for the Royal approval.

The following observations were presented in the discussion of the measure in the Sections of the Second Chamber with respect to those Communes which might probably be brought into financial difficulties by the operation of the law:—

“Taxes on flour and meal are levied in 70 Communes, on butchers’ meat in 148, and on fuel in 101. In those in which the first of these is levied, the other two, for the most part, are found. These Communes accordingly lose most in revenue, and will consequently find the greatest difficulty in providing for their wants on the present footing.

“Of the Communes where the multure tax subsists, there are fourteen which either have not hitherto assessed themselves at all to a direct tax, or at least to a very trifling amount; they are Bois-le-Duc, Bergen-op-zoom, Arnhem, Nijmegen, Tiel, Gorinchem, Gonda, the Hague, Hellevoetsluis, Melissant, Onde Tonge, Helder, Vlissingen and Maastricht. In Arnhem there will be no difficulty about the matter, but the others must now have recourse to the assessment of a direct tax. It is, of course, possible, as in other places, to do this. In the number, however, there are some where this could not be the case, or where, at least, it would be impossible to supply all their wants by direct taxation. At the Helder, for instance, such a tax must be raised to an amount equivalent to 270 per cent., and at Vlissingen to 300 per cent., on the principal sum of the present personal tax.

“The other fifty-six Communes subject to the multure tax are at the same time assessed to a local direct tax. After a searching examination of the

Tables presented by the Government, the conclusion is drawn that, at most, eight of these will be able, without difficulty, to bear the new charges. In those, however, where the new direct tax, together with the existing 'hoofdelijke omslag,' exceeds considerably 100 per cent. of the amount of personal taxes, it may be assumed that so great an increase of direct taxation is impracticable. Forty of the Communes in question would come under these conditions, among which are to be found some considerable towns, such as Brielle, Leiden, Schiedam, Hoorn, and Middelburg. The following instances are cited :—

Communes.	Present Direct Tax.	Additional Direct Taxes to be raised.
		Per cent.
Maasluis	95 per cent. on the amount of personal tax	140
Nieuw Beijerland ..	200 ditto	180
Oud Beijerland ..	50 ditto	210
Pierabil	225 ditto	115
Ridderkirk	200 ditto	115
Edam	150 ditto	120
Hoorn	110 ditto	90
Zaandam	75 ditto	200
Oostzaan	325 ditto	140
Petten	200 ditto	140
Vlieland	60 ditto	500
Middelburg	40 ditto	100
Viere	6 ditto	300

"According to these calculations, there would be about fifty Communes out of the number of those subject to a multure tax which would require aid under the operation of the law.

"There are, moreover, among the Communes not subject to a multure tax, about thirty-five, where, in addition to an 'hoofdelijke omslag,' of from 40 to 400 per cent., the per-centage on the personal tax must be raised to an amount varying from 25 to 280 per cent. Twenty, at least, of them would be plunged into irretrievable difficulties, in addition to the fifty above referred to."

This, however, is the view of the pessimists. Those who are inclined to look upon the matter in a more favourable light, and who consider that additional charges, not exceding 2 florins per head, may

be borne without difficulty, reduce the number to about twenty, which will have to be assisted according to the provisions of the Bills to be brought in before January next.

In what manner, or to what extent, this assistance will be afforded the Government have given no intimation, as it will depend upon the information to be furnished to them in the meanwhile, with respect to the condition of the Communes requiring such assistance.

The Bill for the modification of the personal tax provides for the assessment of that tax on the same subjects as the existing law, the details of which will be found in my Report of the 29th June, 1861. It is, however, cast in a new form, and levied at new rates.

1. The tax on house-rent is raised to 6 per cent., and exemptions are proposed to be granted on certain conditions by the executive power, in concert with the provincial authorities, so as to relieve the poorer classes from an undue pressure of taxation.

2. Doors and windows are to be taxed at an uniform rate of 68 cents each.

3. Hearths will be charged as follows :—

	Fl.	c.		Fl.	c.
One ..	1	0	Six, each ..	3	50
Two, each ..	1	50	Seven „ ..	4	0
Three „ ..	2	0	Eight „ ..	4	50
Four „ ..	2	50	Nine „ ..	5	0
Five „ ..	3	0	Ten or more, each	5	50

4. Furniture will pay at the rate of $1\frac{1}{2}$ per cent. of the value.

In assessing the tax under these four heads a reduction is allowed according to a scale based on the exemptions which have been alluded to under the head of house rent.

The value of furniture for taxation is taken either by valuation or by multiplying the amount of the house rent by certain factors proportioned to the house rent, a Table of which is annexed to the law.

5. Servants are divided into three classes, instead of five, as under the present system, and are charged as follows :—

First Class—				Florins.
Where one is kept	6
two are kept, each	8
three	10
four	12
five	14
six	16
seven	18
eight	20
nine	22
ten or more	24
And for every male servant out of livery, 10 florins additional; in livery, 15 florins.				
Second Class—				
For each servant	6
Third Class—				
For each servant	3

6. Horses are distinguished for the purpose of the tax into four classes:—

(1.) At 24 florins each, those used for riding or driving by the wealthier classes.

(2.) At 12 florins each, such as are employed in drawing vehicles of a humbler description.

(3.) At 9 florins, post-horses and horses used in diligences, &c., or let for hire.

(4.) At 3 florins each, other horses used in riding or driving, and horses for sale in hands of dealers charged at 30 florins for every ten, or number less than ten. Exemptions are allowed for horses used by civil officers in the public service, when such service requires it; for officers of the army in actual service, and of the National Guard; for horses employed solely for agricultural or industrial purposes; for such as are used exclusively in shows.

A reduction of one-fourth of the tax is allowed for horses necessary for the use of medical men and clergymen in the country, as well as for those employed by civil officers otherwise than for the public service, and farmers' horses used under certain circumstances for other than exclusively agricultural purposes.

Mules are charged at one-half the rates for horses.

This law is now under discussion in the Second Chamber, and as it is impossible to anticipate how far it may be modified in passing through the Legislature, it is superfluous to enter into an examination of the details of it.

The same observation will apply to the measure

for re-adjusting the stamp duties, which will be taken into consideration after the discussion of the Bill on the personal taxes.

This measure, if passed in its present shape, will introduce the important change of an abolition of the stamp on newspapers and advertisements, and will, accordingly, require a considerable sacrifice of revenue.

In connection with these measures, a Bill has passed through the Second Chamber raising the excise upon spirits from 35 to 50 florins a vat. As, however, this article has hitherto been subject to communal taxation, there is no increase of duty in the aggregate, since in some parts of the country, and generally speaking in those where the consumption is greatest, it has been taxed at a considerably higher rate.

It now remains to be seen what effect these changes will have upon the revenue of the State.

The statement of the Minister of Finance on this subject is to the following effect :—

	Florins.
The loss of revenue to the State by ceding four-fifths of the personal tax amounts to	5,971,200
And the 21½ per cent. on the land tax	736,000
Estimated loss by the new stamp law	600,000
	<hr/>
	7,307,200

To cover this deficit, in the first place, the increased revenue from spirits is estimated at 3,800,000 florins; on wine, for the first year, 528,000 florins. The excise on this article must be reduced progressively in four years to the rate levied by the State, according to the Treaty negotiated with France which will be concluded as soon as the Bills abolishing the local taxes, and that establishing a new Customs Tariff in Netherland India, shall have become law. Both these Bills have passed the Second Chamber. The Minister reckons on an increased consumption of the articles partly relieved from taxation to supply an equivalent in process of time. It is proposed, further, to take a portion of the local tax now levied on butcher's meat on behalf of the State. The aggregate amount now raised by the Communes under that head is 878,855 florins; 40 per cent. increase on the State Excise, which will be proposed in the Ways and Means for the next financial year, to take effect from the 1st May, 1866, will give 576,000 florins.

At the same time an increase in the duty on tea, of 25 florins on 100 kilogrammes, will be brought forward, estimated to produce an increase of 300,000 florins. And, lastly, it is calculated that the changes in excise on sugar will yield at first an additional sum of 1,504,000 florins, which may be expected to increase progressively to a much larger amount. Adding together these sums, the total gain to be set off against the deficit of 7,307,200 florins is 6,708,000 florins, leaving 599,200 florins as the present sacrifice for the great permanent advantage of the abolition of local taxation on articles of consumption.

(Signed) WILLIAM R. WARD.

Law for establishing an Excise on Sugar.

(Translation.)

Cap. I.—Amount of Excise.

Art. 1. An excise shall be levied on sugar to the amount of 27 florins per 100 kilogrammes, dry white loaf sugar, and for greater or smaller quantities in proportion.

Art. 2. § 1. Other sugars than dry white loaf sugar will be taxed according to their description and quality in the ratio per cent. to the amount above mentioned indicated in column 3 of the following Schedule:—

1. Description and Class of Sugar.	2. Ordinary numbers of Java Sugars comprised in each Class.	3. Ratio (dry white loaf sugar being taken as unity).	4. Amount of Excise per 100 kilogrammes with reference to Article 1, calculated according to Ratio in Column 3. (In case of alterations by virtue of Articles 3 and 4, the Amount of Excise will be brought into conformity with such alterations.)
			Florins.
Refined sugars and sugars placed on the footing of refined—			
Loaf and lumps, and all sugar pounded, crushed, and broken, and machine-made sugar above Java No. 20	1.00	27.00
Candy	1.07	28.89
Raw sugars—			
First class	18—15	0.87	23.49
Second class	14—10	0.85	22.95
Third class	9—7	0.81	21.87
Fourth class	Under 7	0.76	20.52
Extra class	90 and 19	0.75	24.08
Beetards	Classified as raw sugars	above the 1st class	As raw sugars.
Melado, comprising all saccharine juice, unrefined syrup, and molasses containing more than 10 parts in 100 of solid granular sugar, or having in a fluid state more than 60 per cent. of saccharine matter	0.76	20.52
Fruit sugar, solid, granular, and powdered sugar from beets	0.76	20.52

§ 2. Raw sugars and bastards between two successive classes are considered as belonging to the lower class.

Art. 3. We reserve to ourselves the right, until Article III of the Treaty concluded on the 8th November, 1864, between the Netherlands, Belgium, France, and England, is carried out, to increase the ratios indicated in column 3 of the foregoing Schedule for all or any classes of raw sugars and bastards, in case the export of refined sugar during the last six months of 1865, or during any subsequent period of six months, should exceed 35,000,000 kilogrammes. Such increase shall be 1 per cent. where the export exceeds 35,000,000, 2 per cent. when it shall exceed 38,000,000, 3 per cent. when it shall exceed 41,000,000, 4 per cent. when it shall exceed 44,000,000, and 5 per cent. when it shall exceed 47,000,000 kilogrammes. Should, however, the export for the half-year immediately following that on which the increase is calculated fall short of that for the period last mentioned, then the average of the two last half-years shall be taken as the measure for the application of this provision.

Art. 4. The revenue from the excise on sugar is fixed at a minimum of 1,750,000 florins for each six months, to begin from the 1st of January, 1866. If this amount of revenue is not realized on the last day of the six months, the deficiency shall be assessed pound for pound on the unsettled balance of the accounts opened with the refiners, who shall be bound to pay in the sum thus found due within ten days after notice given, notwithstanding protest. Should the assessment to be made at the end of each period of six months amount to 125,000 florins or upwards, then the ratios indicated in column 3 of the Schedule annexed to Article 2 shall be increased by 1 per cent. for each complete sum of 125,000 florins, to take effect from the first day of the following period.

If in the sequel the revenue from the excise shall, during two successive periods, exceed in each case the amount required by this law, the increment applied by virtue of the preceding clause shall be diminished for each complete sum of 125,000 florins, whereby the requisite amount of revenue is exceeded during such period.

Art. 5. We reserve to ourselves, in like manner,

the right of making such modifications in the ratios indicated in column 3 of the above-mentioned Schedule, as may be requisite for carrying out the IIIrd Article of the Treaty.

Cap. II.—Sugar Manufactories within the Realm.

Art. 6. The regulations drawn up in conformity with Article 6 of the Law of the 26th April, 1852, and the Law of the 3rd July, 1863, respecting the levying and securing the excise upon sugar extracted from beetroot or other vegetable substances, remain in force until the 31st December, 1866. We reserve to ourselves, however, the right of making such modifications therein as we may consider necessary, or as may be called for in respect of the present law, and for the execution of the Treaty.

Art. 7. Independently of the provisions respecting the establishment of manufactories on the zone of inspection along the frontiers as defined by Article 177 of the general Law of the 26th August, 1822, no new sugar factory may be set up until our consent has been previously obtained.

Art. 8. It is forbidden to hold or to work a factory or establishment for extracting sugar from beetroot or other vegetable substances, or for preparing sugar from fecula, without having previously made the return or returns required on that behalf by the before-mentioned regulations referred to in Article 6.

Art. 9. Any person obstructing the sealing of machinery prescribed in conformity with the regulations above referred to, or breaking the seals, and continuing, resuming, or beginning his operations with the machinery in question, shall be punished as if he had contravened the prohibition of the preceding Article, independently of the penalty applicable to the offence of breaking the seals or obstructing the sealing.

Cap. III.—Importation. Tare.

Art. 10. § 1. The excise is due on importation, and is calculated according to the weight of the sugars ascertained by the officers, and according to the description and class verified by the examination.

§ 2. The excise on imported sugar not destined for transit, nor for bond, or with the privilege of credit,

must be paid to the receiver in conformity with the provisions of the general law mentioned in Article 7, upon an ordinary excise receipt either at the place of importation, or at the receiver's office, or at the place of his discharge.

Art. 11. § 1. On importation of raw sugar and of melados the gross weight only is ascertained. The following tare is allowed:—

For all wooden boxes and casks, 13 per cent.

For baskets and koanjangs, 8 per cent.; for double bags and other double packings, 4 per cent.; and for single, 2 per cent.

§ 2. If, however, the importation is made in other than the ordinary way of packing raw sugar coming from parts beyond Europe, then the net weight is ascertained; and this practice must be always observed on the importation of raw beetroot sugar, and of all other than raw sugar.

§ 3. The parties interested may, if they are not satisfied with the above-mentioned tare, require the net weight to be ascertained on entry for import, or for taking sugar out of bond.

Art. 12. On importation of raw sugar or bastards elsewhere than at the discharging places, or the offices particularly assigned by us for this purpose, the excise on such sugar shall be calculated as for dry white loaf sugar.

Art. 13. The imported sugar packed together in one package must be of one and the same description and quality. If this should not be the case, then excise is due for the whole quantity contained in the package at the rate of the highest taxed sugar found therein, independently of the penalty for the contravention of the provision of the preceding clause, in case the more highly-taxed sugar is found to be packed or concealed in a fraudulent manner among the rest.

Cap. IV.—*Credit. Debiting and Crediting the Accounts.*

Art. 14. Credit is allowed to refiners and dealers, on giving sufficient security for the excise on raw sugar entered in quantities of not less than 500 kilogrammes in their refineries or warehouses, under their own management.

Art. 15. § 1. Refiners or dealers wishing to enter raw sugar with the privilege of credit must declare in

writing their desire to be debited at the time of making the application for importing, or for taking sugar out of any warehouse or sugar factory, in case such application is made by them at the receiver's office where their account is kept, and in other cases together, a separate application to be delivered before the entry to the said receiver.

§ 2. The entry is considered as taking place on the day of applying for importation or taking out of bond, in case such application is made at the place of entry, and in other cases on the latest day fixed for the transport of the goods to their place of destination, which day is to be stated in the permit for import, or taking out of bond by the receiver who issues such permit.

§ 3. If the separate application prescribed by § 1 is not handed in in time, the privilege of being debited is refused, and the corresponding permit is not admitted in the settlement.

Art. 16. § 1. A credit is opened for the raw sugar entered in the course of each week by the several refiners and dealers, in such manner that the time of each credit begins to run on the last day of the week.

§ 2. The time of credit expires for refiners when the annual entries of raw sugar in their refineries amount in the aggregate to—

- (a.) 1,200,000 kilogrammes or under, at five months.
- (b.) Over 1,200,000, and under 3,000,000 kilogrammes, at four months.
- (c.) Over 3,000,000 kilogrammes, at three months.

§ 3. The amount of the annual entries in a refinery is reckoned according to those of the preceding year, whether the entries are made in the name of one or more persons or firms; and on bringing a refinery into operation which was not working in the previous year, credit is at first allowed according to the scale of lit. *a*. If, however, the entries for a refinery, classed under lit. *a*. or *b*, exceed for the current year those of the preceding year, then those of the current year are taken as the standard, in the same manner as for a refinery not in operation during the previous year, beginning in both cases from the close of the week during which the maximum of 1,200,000 or 3,000,000 kilogrammes has been passed.

§ 4. For dealers the credit expires after the lapse of five months,

Art. 17. § 1. The account between the Excise and

the refiners or dealers enjoying the privilege of credit is kept at the office of the receiver in whose district the refineries or stores in question are situated.

§ 2. The sums due for excise on all entries of raw sugar made by the refiners or dealers are brought into account as debit.

§ 3. The account with refiners for entries of raw sugar from the 1st to the 4th class inclusive, may be settled—

(a.) By exportation of refined sugar and bastards, in conformity with the other provisions of this and of the following chapter ;

(b.) By entry in bond of the like sugar, in conformity with the other provisions of this and of the 6th chapter.

§ 4. The account with dealers, as well as that with refiners, save as provided for in the case of the latter by the preceding paragraph, must be settled by the payment of the sum due on an ordinary excise receipt, before or on the day of the expiration of each credit.

Article 18. § 1. The credit referred to in § 3 (a) of the preceding Article may be given provisionally as soon as the declaration respecting the loading of the sugar, as prescribed by Article 69 of the general Law mentioned in Article 7, is delivered to the receiver. In that case the refiner remains responsible, and his surety is bound for the amount of the set-off until the exportation of the sugar has taken place, and the permit for exportation has been returned properly discharged.

§ 2. The credit referred to in § 3, lit. b, is not allowed until the permit for entry in bond has been returned to the receiver duly discharged.

§ 3. The credits above-mentioned always apply to the first opened term of credit, not being yet entirely or in part written off; they cannot, however, be allowed for a term already elapsed, when the sugar was exported or entered in bond.

Art. 19. As an exception from Art. 275, lit. c, of the above-mentioned general Law, with respect to the security given for the payment of the excise on sugar, the disqualification of sureties engaged in a business for which they have an open account with the State is removed, but under the condition that the same persons cannot be mutually sureties for one another.

Cap. V.—*Exportation of Refined Sugar and Bastards under set-off.*

Art. 20. A set-off against the excise due by refiners exporting refined sugar or bastards in quantities of at least 100 kilogrammes candy, or 200 kilogrammes of other sugar, is allowed to an amount equal to that which would be due according to Cap. I on the importation of the sugar, namely:—

(a.) For candy thoroughly refined and prepared, dry and transparent.

(b.) For loaves and lumps perfectly clear, well dried and hard, and from top to bottom white in the inside.

(c.) For white, centrifugal-machine-made sugar, as entirely clarified and dried as the loaf mentioned in lit. b, and in other respects corresponding with the sample to be fixed for this purpose;

(d.) For bastards of the first, second, third or fourth class.

§ 2. For the purposes of this Article the following descriptions of sugar are placed upon the footing of bastards of the first class:—Candy, white refined and white machine-made sugar, not comprised in the classes for which a higher set-off is appropriated.

Art. 21. § 1. The loaves and lump intended in § 1, lit. b, of the foregoing Article must be presented in loaves for the inspection of the officers, and may, in case of doubt whether they fulfil the necessary conditions, be by them broken through the middle.

§ 2. After the loaves have been found to answer the conditions required under lit. b of the foregoing Article, they may be pounded, crushed, or broken, the refiner retaining the same claim to set-off as for entire loaves; on condition that such pounding, crushing, or breaking, as well as the packing of the sugar, be done under the uninterrupted inspection of officers, who shall thereupon fix leads or seals on the packages.

§ 3. The white machine-made sugar intended in § 1, lit. c, of the foregoing article, must be submitted to the inspection of the officers before packing, and afterwards packed under their inspection; after which the packages shall be provided with leads or seals.

Art. 22. § 1. Refiners are at liberty to load a parcel of sugar for exportation in whole or in part,

under provisional entries to be issued from a register properly authenticated by the receivers.

§ 2. In such case the examination is made on each entry, and the same penalty is applicable on discovery of a variance liable to a fine, as on examination in the case of a permit for exportation.

§ 3. The provisional entries are to be given back to the parties interested after endorsement. They must refer to these in their subsequent entry for obtaining a permit, which will be endorsed by the proper officers on withdrawing the provisional entries, unless a re-examination of the entire parcel should be demanded.

Art. 23. § 1. Refiners must enter the description of sugar to be exported in such a manner that it may be clear to which class it belongs according to the distinctions given in Article 20.

§ 2. Sugar entered as belonging to the same class cannot be mixed with nor partly consist of sugar of another description or quality for which a lower set-off is allowed. In case of contravention of this prohibition, the set-off for the whole parcel thus entered will be calculated according to the lowest description of sugar found in it, independently of the fine incurred.

Art. 24. § 1. In the entries and provisional entries for export the gross as well as the net weight of each description of sugar must be stated.

§ 2. The like statement must also be made in a list signed by the refiner, and attached to the entry or provisional entry for each cask or other package separately, except for candy packed in cases not exceeding 50 kilogrammes.

§ 3. Each package must be marked with the gross and net weight.

Art. 25. § 1. In the net weight to be stated, no paper, or cord, or any part of the wrappings of the loaves is to be included.

§ 2. The net weight must not be declared higher than it really is. An allowance of 1 per cent. is however, made; but on these terms, that the document will be only endorsed in proportion to what it is found to be short, distributed equally over the whole quantity entered, in case it should prove, upon examination of any package, that the refiner in making his entry has increased the real weight by that allowance or any part thereof.

§ 3. If in the net weight of one or more packages a greater difference be found than 1 per cent., then the refiner may be fined for that difference, unless the officers choose to proceed to a thorough examination of the whole parcel. The refiner, however, may on his own behalf, either in person or by any one present in his name, demand such examination immediately on the imposition of the fine, or at least before the packages in question have been removed from the uninterrupted inspection of the officers imposing the fine, in which case no liability to fine is incurred unless the collective weight of the whole parcel is entered higher than 1 per cent. above the actual weight.

Art. 26. § 1. Permits for exportation are not considered as duly cancelled unless, independently of the requisite declaration by the officers that the exportation has taken place, proof is subsequently given to the receiver in the cases hereinafter mentioned, and at farthest within the time fixed in the permit, that the sugar has been imported into the country of its destination by the means of conveyance as stated, that is to say:—

(a.) On exportation of all descriptions of sugar by river and by land, as well as by sea in ships of less than 50 last burden;

(b.) On exportation by sea of loaves and lumps, and of crushed and machine-made sugar otherwise than in casks of 80 kilogrammes at least, capable of being sealed and leaded, unless the chief officer at the place of shipment, after it has been shown to his satisfaction that the despatch has been really made to the country as stated dispenses with this obligation previously to the despatch.

§ 2. The proof must consist of a declaration by the officers of the Customs or other public officers in the country of destination, and must be legalized by a Netherlands Consul or Agent where such Consul or Agent is established. Its place may, in case of necessity, be supplied by other papers from which it may appear to the satisfaction of the receiver that the sugar has arrived at the place of destination, or that it has been prevented from so arriving by circumstances independent of the will of the shipper.

Art. 27. In case of a short detention of sugar despatched on permit for exportation, it may be

temporarily bonded on the same footing as allowed for goods in transit by Articles 82 and 83 of the General Law mentioned in Article 7.

Cap. VI.—*Bonding and Transit.*

Art. 28. Bonding of raw sugar is only permitted :—

(a.) For raw sugar, in the places opened by us for importation by virtue of Article 12; as well as in such places where one or more sugar factories or refineries are or may be established;

(b.) For refined sugar and bastards, in the places of discharge assigned for importation by sea as well as in such other places as shall be assigned by us for this purpose for the benefit of trade, if necessary.

In both cases, if there be a public bonding warehouse in the places designed in lit. *a* or *b*, or if in such places the privilege of a private bonding warehouse for sugar is or may hereafter be granted.

Art. 29. The private bonding warehouse for refined sugar, as well as for raw sugar bonded directly out of sea-going ships, is placed on the footing of a public bonding warehouse for the purposes of this Law and of the general Law mentioned in Article 7, provided that the premises in question are so situated and arranged that access to the stores without the knowledge of the servants of the Excise can only be had by an act of violence; and that such premises are especially approved by the Excise for the purpose of being employed for bonding sugar with the privileges which result from the provisions of this Article.

Art. 30. The minimum quantity of home-made or foreign sugar which may be bonded is fixed at 500 kilogrammes, as well for raw as for refined sugar and bastards. This minimum also applies to the case of transfer in bond, and to that of transport from one bonded warehouse to another.

Art. 31. Delivery out of bond cannot take place for smaller quantities than those hereinafter mentioned :—

(a.) For sugar intended for transit, or for export with set-off, 200 kilogrammes raw sugar, 100 kilogrammes candy, 200 kilogrammes other refined sugar, or 200 kilogrammes bastards.

(b.) For raw sugar intended for entry under the privilege of credit, 500 kilogrammes.

(c.) For all descriptions of sugar intended for delivery on payment of excise, 200 kilogrammes, except in the case of a smaller quantity remaining over in bond.

Art. 32. § 1. Refiners sending off or delivering for the purpose of bonding refined sugar or bastards, either in their own names or in the name of a dealer or broker, are allowed the same set-off in their accounts as on exportation of such sugar to foreign countries.

§ 2. The provisions of Articles 22 to 25, inclusive, respecting entries and permits of export, are declared to be applicable to the entries and permits for such bonding.

Art. 33. § 1. Refined sugars and bastards bonded by refiners may be cleared out by those in whose names they are entered in the bonding account:—

(a.) When intended to remain in the country on payment of excise;

(b.) When intended for export to foreign countries, on giving security for the excise.

§ 2. In the case provided for by lit. b, the person making the entry is subject to the provisions respecting entries and permits for exportation of Articles 22 to 27, inclusive, of this Law, and of Cap. IX of the General Law mentioned in Article 7.

Art. 34. On transit of sugar the same provisions are applicable to the transit permits, with respect to the delivery of proof of arrival of the sugar in the country of destination, as are enacted by Article 26 with reference to permits for export.

Cap. VII.—*General Provisions.*

Art. 35. § 1. The standard samples for determining the classes of raw sugars and bastards, and for distinguishing refined sugars, as well as the rules to be observed in making these arrangements, will be settled by our Minister of Finance, in conformity with the result of the Conference referred to in Article XVIII of the Treaty mentioned in Article 3 of this Law.

§ 2. Samples agreeing with those standard samples

will be lodged by the Excise in the bonded warehouses at Amsterdam and Rotterdam for the inspection of parties interested.

Art. 36. § 1. Two Committees of persons acquainted with the subject will be appointed, one at Amsterdam and one at Rotterdam, who shall be empowered to decide in disputes with regard to the description or class of sugar.

§ 2. Each Committee will consist of three members ; one, the presiding member, to be named, and if necessary dismissed, by our Minister of Finance, one member by the Chamber of Commerce and Manufactures, and one by the District Court of Justice. The members are appointed for the period of two years, but may be reappointed.

§ 3. For each of these members one or two substitutes shall be named upon the same footing, and at their recommendation, to supply their places in case of their inability to serve.

§ 4. The members and their substitutes shall be sworn or shall promise before the President of the Court of Justice "to perform the duties required of them as members of that Committee, in good faith, conformably to the provisions of this law."

§ 5. The Committees shall meet on the summons of the presiding member, as often as it shall be necessary, in order from time to time to decide with as little delay as possible the differences arising between the Excise and the trade. Should one of the members be absent, and no substitute be at hand to supply the place of such member, then a Controller of Taxes, to be named by the presiding member, shall occupy the vacant place.

§ 9. To each of the members named by the Chambers of Commerce and Manufactures and by the Courts of Justice a salary shall be assigned by us.

Art. 37. § 1. The right to require a re-examination of the quantity or of the description or class of sugar, whether for an entire parcel or for a portion of it, is reserved to each party separately with reference to all surveys of sugar, in conformity with the provisions of this Law and of the General Law mentioned in Article 7.

§ 2. If, in case of dispute with respect to the determination of the description, class, or category of

sugar, one of the parties does not accept the result of the second survey prescribed by Article 150 of the above-mentioned General Law, then the sealed samples of the sugar shall be delivered without delay on behalf of each party to the Director of Taxes of the province, in order to be laid for inquiry before the Committee appointed for this purpose, whose decision shall be final.

§ 3. Pending such decision, the sugar respecting which the dispute has arisen may be bonded, delivered out of bond, or dispatched on depositing with the warehouse keeper or receiver other samples on behalf of each party, in addition to those already sent in, and on giving security for the excise, calculated on the scale of the highest survey.

§ 4. If the Committee decide in conformity with the survey against which the party making the entry or other party interested has appealed, the latter shall pay, as costs to the State, 10 florins for each decision passed against him.

Art. 38. § 1. The following payments will not be exacted:—

(a.) Of fees for dispatch, for visitation, and on account of signatures to any papers relating to the excise on sugar.

(b.) For the cost of weighing, surveying, and passing sugar, excepting only such as are intended in Article 152 of the above-mentioned General Law of 26th August, 1822.

(c.) For the cost of sealing or leading packages of sugar, as well as for the cost of sealing or leading vessels or carts, so far as such operations take place on account of loading sugar.

(d.) For the costs of the notice prescribed by Article 288 of the above-mentioned General Law.

§ 2. The importer, refiner, or other party interested is, however, bound to provide the labourers required on the occasion of such weighing, surveying, and passing of sugar as is prescribed in lit. b, as well as such articles as are suitable for unpacking or repacking the sugar temporarily, when required for ascertaining and entering the net weight. In case of non-compliance with this obligation, it shall be provided for at the cost of the party by the officers.

§ 3. The officers are empowered, on the survey or

D

passing of the sugar, to take samples, which they will return to the parties on their receipt, after making the requisite use of them.

Art. 39. The special provisions respecting the transport and deposit of exciseable goods enacted by Articles 166-169, 177, 178, 185-189, 205-208, and 210 of the General Law of the 26th August, 1822, shall be declared applicable to sugar also within the zone of inspection along the frontier both on the sea and land side, as described in the 177th Article hereinbefore referred to, with the condition that each parcel exceeding 3 kilogrammes, according to Articles 166 and 187, must be covered by a document, and that portion which may be, according to Article 185, § 4, in use without being covered by a document, shall be fixed also at 3 kilogrammes per head or member of a family.

Art. 40. § 1. The following alterations shall be made in the Tariff of Duties.—

(a.) The articles “stroop en suiker,” as described in the Schedule enacted with Article 1 of the Law of 15th August, 1862, are struck out.

(b.) In that Schedule the following new Article is introduced:—

Article.	Standard.	Duty.
	Kilogrammes.	Florins.
Stroop (treacle),* manufactured kitchen and all other treacle, molasses, or saccharine juice, so that it does not contain more than 10 per cent. solid parts chiefly composed of granular sugar, nor hold in a fluid state more than 50 per cent. of saccharine.†	100	6

§ 2. With reference to Article XIV of the Treaty mentioned in Article 3, and in connection with an international agreement to be entered into hereafter with respect to that point, we reserve to ourselves the

* Subject to the provisions necessary for preventing abuse, to be settled by us, remission of duty is allowed for molasses and other saccharine juices intended to be employed for distillation in this country.

† Treacle, molasses, and other saccharine juices must, in order to be admitted at this rate of duty, be cleared in one of the places of discharge or Custom-houses especially appointed for the importation of raw sugar. When imported in any other way these articles are classed as *malados*, and taxed as sugar according to the excise law. In case of dispute respecting the proportion of saccharine in the article between the person making the entry and the officers, the same manner of proceeding is observed as in the case of a similar dispute respecting the determination of the classes of raw sugars.

right of levying, or not, an import duty on foreign refined sugar, not exceeding 4 per cent. of the excise due thereon.

Cap. VIII.—Fines and Penalties.

Art. 41. The offences hereinafter mentioned shall be punished as follows:—

§ 1. Having or bringing into operation a factory or establishment for extracting sugar from beetroot or other vegetable substances, or for preparing sugar from fecula, contrary to Articles 7, 8, or 9, with fine imposed on the occupier of such factory or establishment of 1,000 florins, together with forfeiture of the utensils employed in the business.

§ 2. Importation of sugar packed or concealed in a fraudulent manner among lower taxed sugar, contrary to Article 13, with fine imposed on the importer of ten times the amount of the excise, calculated on the whole quantity of sugar contained in the package in question, and with forfeiture of such sugar.

§ 3. Entry of sugar for export under a description or class for which a higher set-off is allowed than that corresponding to the class to which the whole or a part of the parcel entered belongs, contrary to Article 23, with fine imposed on the party entering of ten times the difference between the set-off calculated according to the entry, and that to which the sugar shall, upon examination, be found to be entitled. If, however, the lower-taxed sugar is evidently packed or concealed in a fraudulent manner among the rest, with ten times the amount of the set-off calculated on the scale of the entry, and with forfeiture of the whole parcel of sugar.

The same penalty is imposed in the case of entry for bonding, or for exportation out of bond, were by virtue of Article 32, § 2, or Article 33, § 2, the provisions of Article 23 are applicable.

§ 4. Entering in excess the weight of one or more packages belonging to a parcel of sugars for exportation, contrary to Article 25, with fine on the party entering for each package separately of five times the amount of set-off calculated according to the quantity entered, where the deficiency in weight is from 1 to 5 per cent. of such quantity, and of ten times the amount where the deficiency exceeds 5 per cent.

Independently thereof the sugar is forfeited if the deficiency exceeds 10 per cent., or if the weight is fraudulently increased by sand or other substances mixed with sugar or packed with it.

The same penalties are imposed in the case of entries for bonding or for export out of bond, where, by virtue of Article 32, § 2, or Article 33, § 2, the provisions of Article 25 are applicable.

§ 5. By exception from the 1st clause of Article 216 of the General Law mentioned in Article 39, the entry in excess of the weight of an entire parcel of sugar entered for export or for bonding, contrary to Article 25, with the same penalties as according to the foregoing paragraph; with this understanding, however, that the fine shall only be calculated upon the weight found to be in excess, unless in the case of the weight having been increased in the fraudulent manner above mentioned.

§ 6. The absence of one or more packages out of a parcel of sugar entered for export or for bonding, with fine imposed on the party entering of 100 florins for each package deficient, independently of the existence or non-existence of such a deficiency in the weight of the whole parcel as would be liable to fine.

This paragraph is applicable also to the carrier, in the case provided for by the second clause of Article 216 of the above-mentioned General Law.

Art. 42. § 1. The casks, boxes, bags, and other wrappings in which the sugar is found when forfeited on account of illicit delivery out of bond or transport or on account of false entry, are including in the forfeiture.

§ 2. Utensils declared forfeit by sentence of Court must, within eight days after the sentence has become final, be broken up by the defendant and be removed by or on account of the Excise. If the defendant does not comply with this obligation, the Excise may proceed to break up the utensils at his cost and risk.

Art. 43. Contravention of what has been prescribed by us, or shall hereafter be prescribed by the regulations mentioned in Article 6, so far as no special penalty attaches to it by Article 41, or by the General Law mentioned in Article 39, will be punished with a fine of 50 and not exceeding 500 florins.

Cap. IX.—*Transitory and concluding Provisions.*

Art. 44. The provisions of Articles 1 and 2 of the Law of 6th April, 1852, in connection with those of Article 1 of the Law of 14th June, 1855, shall be applicable to the term of six months running out when this Law comes into operation, until the day preceding such coming into operation, calculating the minimum of production according to the time elapsed.

Art. 45. § 1. The provisions of Articles 12-14 and 15, last clause, and 16-24 of the Law of 1st April, 1846, and of Article 2 of the Law of 15th May, 1859, on the subject of balancing the account, of export to foreign countries, and of bonding refined sugars, remain temporarily in force as far as respects the balancing of the terms of credit opened before the present Law shall come into operation.

§ 2. Refiners having at the same time terms of credit opened before and after the coming into operation of the present Law, shall mention in their entries for export on which credits they desire the set-off to be made.

Art. 46. The present Law comes into operation at such time subsequently to the exchange of the ratifications of the Treaty mentioned in Article 3 as we shall hereafter fix.

From that period the Laws of 1st April, 1846, 26th April, 1852, 14th June, 1855, 15th May, 1859, as far as relates to the excise on sugar, and of 3rd July, 1863, are repealed, save and except that which is enacted by the two preceding Articles with respect to the temporary obligation of some of their provisions.

France.

*Report by Mr. Grey, Her Majesty's Secretary of Embassy,
on the Commerce and Industry of France.*

Paris, May 1865.

AMONG recent official publications there has appeared a bulky volume which gives the results of the last census in France. I propose to devote a considerable portion of the present Report to an examination of this subject, which is one of considerable importance and interest, and which, in this country, presents some curious features.

The enumeration of the population of France is taken every five years. The mechanism of this operation has been very considerably improved of late, especially since the direction of the Statistical Department has been confided to M. Legoyt, one of the most distinguished statisticians of the present day. Notwithstanding the care with which the census is now taken in France, it is, perhaps, still inferior in point of accuracy and detail to the decennial censuses of England and Belgium. In those two countries the enumeration of the population is effected by Commissioners specially appointed for the purpose, and takes place on a fixed day throughout the country. In France, the census is only simultaneously taken in the public institutions, such as barracks, arsenals, hospitals, colleges, asylums, &c.; as regards the great mass of the population, the process of enumeration generally lasts for several months, being conducted by the ordinary local authorities, who consult their own convenience, and in many cases call in the assistance of any well-known persons in their district. This method of taking the census necessarily involves numberless omissions, irregularities, and inaccuracies. But although the existence of local and provincial inaccuracies may be admitted, the general result is, nevertheless, not impaired to the extent that might be

supposed, for the inaccuracies are more or less balanced and rectified by the revision which the results arrived at in the various provinces and districts are subjected to at head-quarters. Moreover, the apprehensions which were formerly caused (for obvious reasons) among the rural population by the taking of the census are gradually disappearing, as the certainty gains ground that the enumeration of the people has no fiscal end in view, and the persons charged with the operation, who used to be alarmed at the increase of trouble entailed upon them, are now no longer so afraid of undertaking the duty and perform it more conscientiously. The chances, therefore, are that each new census contains fewer inaccuracies than its predecessor.

This fact may possibly have contributed to the more satisfactory result which the last quinquennial census undoubtedly exhibited, as regards the increase of the population of France. That census was taken during the last six months of 1861; but the result has only been quite recently published in a volume of great bulk, which, however, is compiled with great clearness and precision.

The census of 1861 shows an increase of population considerably beyond the average at which we arrive on consulting any former census. The following figures show the number of the population of France according to the census of 1861 and the five which preceded it:

Year in which Census was taken.	Population.	Absolute Increase in five years.	Annual Increase per 100 Inhabitants.
1836	33,540,910
1841	34,250,178	689,269	0.41
1846	35,400,486	1,170,308	0.68
1851	35,783,170	382,684	0.22
1856	36,139,364	356,194	0.20
1861	36,717,254	577,890	0.32

These figures show that the yearly increase of the population was greater during the last quinquennial period than it was in the ten preceding years, although it does not amount to one-half of what it was during the period between 1836 and 1846. But it may very well be that the extraordinary increase which the Table gives for the years 1836 to 1846 may, in some

measure, be due to the improvement which was then effected in the mode of taking the census, and by which a number of omissions were rectified.

The above Table only contains the returns of the population in the eighty-six Departments in which the census was taken. In order to arrive at the real amount of the population of France in 1861, we must add that of the three Departments annexed to the Empire after the Italian war. The population of those three new Departments was, according to the Census of 1861:—Alpes Maritimes, 194,578; Savoie, 275,039; and Haute Savoie, 267,496; total, 737,113 souls. From this we must deduct the population (68,054) of the district of Grasse, which has been taken from the Department of the Var, and added to the ancient county of Nice to form the Department of the “Alpes Maritimes.” The increase in the population of France through these annexations, therefore, amounts to 669,059 inhabitants, which, added to the figures above quoted, gives a general total of 37,386,313 inhabitants in the eighty-nine Departments of France. Taking the twenty-five years (from 1836 to 1861) together, during which the censuses have been taken, we find that in twenty-one Departments (*viz.*, Cantal, Basses Alpes, Haute Saône, Eure, Jura, Hautes Alpes, Gers, Arne, Calvados, Lot et Garonne, Tarn et Garonne, Meuse, Ariège, Lozère, Creuse, Puy de Dôme, Basses Pyrénées, Côte d’Or, Manche, Sarthe) the population is now numerically less than it was a quarter of a century ago; on the other hand, in twenty-three Departments (*viz.*, Seine, Bouches du Rhône, Rhône, Loire, Nord, Loiret Inférieur, Corse, Gironde, Var, Vendée, Allier, Gard, Haut Rhin, Hérault, Loiret, Loir et Cher, Maine et Loire, Seine Inférieure, Saône et Loire, Deux Sèvres, Charente Inférieure, Ile et Vilaine, Indre et Loire), the population has been constantly on the increase. The population of the remaining forty-two Departments fluctuated during this period, sometimes augmenting, sometimes decreasing, but finally, in 1861, reached a higher figure than it did in 1836.

The twenty-three Departments above mentioned, in which the population has been constantly increasing, are those in which the largest or principal manufacturing cities of France are situated, such as

Paris, Marseilles, Lyons, Rouen, Nantes, Bordeaux, &c. One of the most remarkable features in the movement of the population of France is indeed the progressive absorption of the rural population by the towns. Thus if we take the 170 towns which in 1836 had a population of above 5,000 souls, we find that the total number of their inhabitants has increased in these twenty-five years from 4,186,962 to 6,408,124. This is an average yearly increase of 2·12 per cent., whereas during the same period the increase in all the other French communes was only 0·13 per cent.; the general average is 0·35 per cent. The official statistical documents make another distinction in classifying the population, viz., between the urban and the rural population, classing under the former all localities which contain at least 2,000 inhabitants; and the following Table shows the result of the last four censuses taken and classed according to this method:—

URBAN POPULATION.

Year of Census.				Population.	Absolute Increase.	Increase per cent.
1846	8,646,743
1851	9,135,459	488,716	5·65
1856	9,844,828	709,369	7·76
1861	10,789,766	944,938	9·60
From 1846 to 1861	2,143,023	23·01

RURAL POPULATION.

Year of Census.				Population.	Absolute Increase.	Increase per cent.
1846	26,753,743
1851	26,647,711	—106,032	—0·40
1856	26,194,536	—453,175	—1·70
1861	26,596,547	+402,011	+1·53
From 1846 to 1861	—157,196	—0·57

From these figures we see that during this period the urban population has increased by nearly one-fourth at the expense of the rural population, which has diminished by about 0·60 per cent.

Upon the whole, the progress of the population of France is remarkably slow; slower, indeed, than in

almost any other country in Europe. For instance, if we base our reckoning upon the average obtained of late years, we find that it would require no less than 198 years to double the actual population of France, whereas that of Great Britain would double itself in 52 years. The only countries in Europe where the increase of population progresses more slowly than in France are Austria and Wurtemberg, where 267 years and 248 years would be respectively required to double the existing amount of population.

It is not to want of space that this slowness in the development of the population is to be attributed in France, which is, comparatively, by no means thickly peopled. On an average, the population of France is reckoned at 69 souls per square kilomètre, whereas in Belgium it is reckoned at 161, in Saxony 149, in Holland 141, in England 91, in Wurtemberg 89, and in Italy 84. France is therefore considerably below even the last-named country, and is closely followed by Bavaria, which only reckons 62 inhabitants per square kilomètre.

The following Table gives the Return of the population of France resulting from the last census, and classed according to the importance of the several localities:—

Rank of Commune.	Number of Communes.	Population.	Average Number of Inhabitants.	On 10,000 Inhabitants of Total Population.
Above 500 souls	16,547	5,058,448	806	18.58
From 500 to 1,000 souls	11,757	8,288,110	705	22.17
" 1,000 " 5,000 "	8,727	15,330,389	1,757	41.00
" 5,000 " 10,000 "	298	1,981,816	6,650	5.80
" 10,000 " 20,000 "	111	1,488,437	13,409	3.98
" 20,000 " 50,000 "	49	1,508,641	30,686	4.02
" 50,000 " 100,000 "	13	835,538	64,272	2.24
Above 1,000	7	1,203,793	171,970	3.22
Paris	1	1,696,141	1,696,141	4.54
Total	37,510	37,356,813	997	100.00

Let us add that in 1861, these 37,510 communes contained 7,632,988 houses, classed as follows:—

Houses having only a ground floor	4,573,424
Ditto, a ground floor and one story	2,299,267
Ditto ditto and two stories . ..	560,682
Ditto ditto and three stories	138,436
Ditto ditto and four stories	34,931
Ditto ditto and more than four stories ..	26,198
Total	7,632,938

Of the above, 19·45 per cent. are composed of houses roofed with thatch or shingles, and the remaining 80·55 per cent. are roofed with tiles, slates, or zinc. In 1856, the proportion of thatched dwellings was still above 20 per cent., so that some increase of affluence is perceptible. Comparing the number of houses to that of the population, we obtain an average of 4·90 inhabitants per house; but this result varies according to the Departments Seine and Eure, which represent the two extremes, giving respectively an average of 23·96 and 3·35.

Among the other points treated by the Census of 1861, there are several which are worthy of remark. Let us first consider the Returns referring to origin and nationality. Of the 37,400,000 souls of which the French population was composed, it was reckoned that 497,091 were foreigners, of whom 285,953 were males, and 211,138 females. More than two-fifths of these (204,139) were Belgians; next come the Germans, 84,958; Italians, 76,539; Spaniards, 35,028; Swiss, 34,749; English, 25,711 (of whom 14,404 are females); Poles, 7,357; Americans, 5,020: the remainder is made up of a number of other nationalities. To the total above mentioned must be added 9,290 persons whose nationality was not ascertained, and 15,259 foreigners naturalized in France. There then remains a total of 36,864,678 souls to represent the purely French population of the Empire. Of this total there were but 3,683,579 inhabitants who were domiciled in Departments where they were not born; the other 33,000,000 (more than 88 per cent. of the whole) were established in their native Departments. This is an additional proof how much a Frenchman likes to stay at home, and how averse he is to emigration even in his own country. But a Frenchman is still more averse to emigration abroad. Simultaneously with the home census, the Department of Foreign Affairs caused an enumeration of French subjects settled abroad to be

taken by the French Diplomatic and Consular Agents. The total of these only amounted to 316,582 persons, distributed as follows in the four quarters of the globe :—

In Europe	127,436 French.
North America	113,043 „
South America	58,535 „
Africa	14,488 „
Asia	3,080 „

In Europe, the country which contains the greatest number of French settlers is Switzerland, where there are 45,000; Belgium has 35,000; England, 13,000; Spain, 10,642; Prussia, 5,000, &c.

None of the figures above quoted include Algeria or any of the other French Colonies. The latter in 1861 contained a population of 843,109 souls, distributed as follows :—

Name of Colony.	Population.
Martinique	135,991
Guadeloupe and Dependencies	138,069
French Guiana	23,107
Réunion	183,491
Sénégal and Dependencies	113,398
French settlements in India	220,478
Mayotte and Dependencies	25,501
St. Pierre and Miquelon	3,074
Total	843,109

Of this total, 784,168 inhabitants belonged to the fixed population; the rest, 58,941, composed the floating population (civil functionaries, garrisons, &c.).

With regard to Algeria the following Table gives the result of the census of 1856 and of that of 1861, together with the distribution of the inhabitants :—

Class of Population.	1856.	1861.	Absolute Increase.	Annual Increase per cent.
French	92,750	112,229	19,479	4·20
Foreigners	68,048	80,517	12,469	3·66
Arabs of the towns ..	123,250	358,760	235,510	22·00
„ tribes ..	2,184,099	2,374,091	189,992	1·74
Jews	21,388	28,097	7,049	6·71
Miscellaneous	8,388	13,142	4,754	11·55
Total	2,497,923	2,966,836	469,253	—

To this must be added the strength of the army, 63,000 (in 1861), and more than 32,000 natives belonging to foreign tribes, which together make up the total of the population of Algeria to about 3,062,000 souls.

Let us return to France, and again extract from the census of 1861 some details of importance. It is hardly necessary to touch upon the classification of the population according to creeds; for of the total population more than 87½ per cent. belong to the Roman Catholic religion. There are 802,339 Protestants, 79,964 Jews, 12,095 persons belonging to other sects not Christian, and 11,824 whose religion is not stated.

The classification of the people according to their professions or social position is more important and more curious. The Table which follows gives not only the persons exercising any particular trade or profession, but also those dependent upon them, *i. e.*, the heads of families, with their wives, children, and belongings:—

Class or Employment of Population.	Males.	Females.	Total.
Agriculture	9,918,838	9,954,655	19,873,493
Manufacture	5,524,880	5,475,147	11,000,027
Commerce	745,219	792,657	1,537,876
Various professions connected with the above three	78,433	69,733	148,166
Other employments ..	77,957	95,404	173,361
Liberal professions ..	960,601	589,398	1,549,999
Clergy	79,584	124,893	204,477
Professions not specified ..	1,259,764	1,639,150	2,898,914
Total	18,645,276	18,741,037	37,386,313

We learn from this Return that the agricultural population occupies the first place, absorbing as it does 53·15 per cent. of the whole: next in order are the manufacturing population (29·42 per cent.), liberal professions (4·15 per cent.), commercial population (4·11 per cent.), miscellaneous (0·9 per cent.), the clergy (0·5 per cent.). The rest composed of persons whose means are not specified. Two elements of the above Return—agriculture and manufacture—which together embrace about 83 per cent. of the whole population of France, require to be considered more in detail. In the first place I give the classification of the agricultural population:—

FRANCE.

Agricultural Population.	Males.	Females.	Total.
Proprietors cultivating their own estates and inhabiting them	4,530,478	4,557,534	9,088,012
Proprietors whose estates are managed by stewards or agents.. ..	118,373	104,027	222,400
Farmers paying a yearly rent	1,568,260	1,495,520	3,063,780
Tenants paying a fixed portion of the produce of the land	747,550	732,343	1,479,893
Day labourers and labourers	2,609,802	2,743,497	5,353,299
Wood-cutters and charcoal-burners	151,367	139,369	290,736
Farriers and blacksmiths	53,844	50,840	104,684
Market gardeners	20,397	17,497	37,894
Flower ditto	14,188	11,787	25,975
Land surveyors	8,168	7,094	15,262
Other agricultural employments	96,411	95,147	191,558
Total	9,918,838	9,954,055	19,873,493

It is evident from these figures that France is an eminently agricultural country, inasmuch as considerably more than half its total population derives its subsistence from agricultural employments, while in England the proportion at the present time does not exceed one quarter, and on the Continent generally fluctuates between 30 and 40 per cent. It is also worthy of remark that more than half of the French families living by agriculture are composed of the landowners who live on their estates and cultivate them themselves. Absenteeism has not made much progress in France, at least not among the landowners; it is rather to be found among the agricultural labourers, who being attracted by higher wages and a life of greater amusement desert the country for the towns, and thus produce the result I have mentioned above, viz., the diminution of the rural population.

The above list of the agricultural population of 10,000,000 scarcely comprehends all the persons who live by agriculture. About 900,000 of the individuals classed under the head of "no profession" should be added, as they live on the produce of their estates, which are farmed out.

The next Table gives in comprehensive groups a classification of the French population living by manufacture (industrie):—

Manufacturing Population.	Males.	Females.	Total.	Proportion in 10,000.
Employments in—				
Textile manufactures (cotton) ..	874,818	1,072,162	1,946,680	1,770
Mining and quarrying	203,281	165,985	369,266	336
Working in metals	74,914	61,980	136,894	124
„ metal wares	257,984	199,515	457,499	416
Leather manufactures	56,488	46,494	102,982	94
Wood	146,394	117,414	263,808	240
Pottery	112,366	91,207	203,573	185
Chemical products	32,572	26,777	59,349	54
Building	1,199,066	921,303	2,120,369	1,927
Lighting	26,325	22,072	48,397	44
Furnishing	68,249	57,748	125,997	114
Clothing	757,770	1,172,863	1,930,630	1,755
Ministering to food	856,676	807,570	1,664,246	1,513
Carriage or transports	661,126	536,222	1,197,348	1,088
Works of art, science, letters, &c. ..	62,812	56,905	119,717	109
Manufacture of fancy and ornamental articles	74,527	65,770	140,297	128
„ munitions of war	29,397	25,256	54,653	50
Miscellaneous	80,415	27,904	58,319	53
Total	5,524,880	5,475,147	11,000,024	10,000

It is worthy of remark that the proportion of persons employed in the textile manufactures (1,770 in 10,000), as well as in mining (124 in 10,000) was lower in 1861 than what it was in 1856 (1,794 and 128 in 10,000 respectively); on the other hand the proportion of persons employed in building has increased to 1,927, being higher by 71 than it was in 1856. The proportion of persons employed in ministering to the food of the people has increased from 1,393 to 1,513 (in 10,000), whilst that of those employed in making clothing has fallen from 1,868 to 1,755. It would not be within the limits of this Report to enter into the causes of these variations, nor would such an inquiry be of great interest. I have already dwelt at greater length than I intended upon the census, but I have done so from a conviction that nothing contributes more effectually to a true appreciation of the condition of a country than a knowledge of the elements of which the population is composed. I propose also to consider a subject bearing some relation to the above which concerns the labouring classes in France, and which appears likely to become one of very considerable importance, both social and political, namely, the projected law concerning the workmen's or co-operative associations (*"associations ouvrières ou co-opératives"*). I shall therefore pass over more

rapidly than usual the ordinary subjects to which my Reports have hitherto been directed, and which I shall have a better opportunity of treating hereafter.

The present session of the French Chambers appears likely to be more especially occupied in the consideration of subjects of an economical nature, subjects which we have already seen took so large a share of the Emperor's speech on opening the Chamber on the 15th of February. Among economical reforms promised by the Emperor, I would first call attention to the changes which it is proposed to introduce in the legislation affecting commercial companies; a legislation which had been materially modified in 1856 by the law relating to companies "en commandite," and in 1863 by that relating to companies under limited liability. The effect of the last-mentioned law, which it was hoped would give a great impulse to the association of capital, has not been a success; indeed, hardly any companies have been formed under its provisions. The principal cause of the failure is, I am told, generally attributed to the old spirit of restriction and limitation which still characterizes the new law, and which has prevented the capitalists from availing themselves of it. It is now proposed, according to the Imperial speech, to give "greater liberty" to the formation of companies, and to "diminish the nominal responsibility of their directors" ("dégager la responsabilité toujours illusoire de l'administration"). This appears to mean that an endeavour will be made to extend the sphere of action of companies under limited liability, and to enable those companies in every respect to take the place of the *anonymous* companies. This latter form, which is a mere obstacle to commercial enterprise and an embarrassment to the Government, would thus disappear, or at all events be very exceptionally employed.

The law which is to reform the legislation affecting the above-mentioned companies will also contain provisions affecting co-operative societies ("sociétés de co-opération"). It will be the first time that the French legislature will have taken into consideration the question of co-operative societies, or associations of the labouring classes. The object is, says the Imperial speech, to remove the impediments which exist to the formation of such societies, and "to give

facilities to an experiment which seems to be destined to contribute to the amelioration of the condition of the labouring classes." The fact is, that of late years this subject has acquired such importance that it is no longer possible for the Government to ignore it. There seems indeed to be, though in a moderate degree, a revival of the ideas by which the labouring classes were so much agitated in 1848, when, under the auspices of the ultra-democratic party, a number of co-operative societies sprung up and were subsidised by the Government, a measure which greatly contributed to their ruin. Most of these societies died a natural death, and the Government of December 1851 discouraged their formation to the utmost of its power. Very few of the original societies of 1848 have survived; but at the present time the movement has greatly gained ground in France under the influence of the example set in England and Germany, and the success of co-operative societies abroad has been made use of by men of ability here to induce the French operatives to follow suit. The most important and the most successful step in this direction was the establishment of the "Société du Crédit au Travail," which was instituted at Paris on the 28th of September, 1863, with a capital of 20,120 francs, of which only 4,182 francs were realized. At the beginning of 1865 this society had 720 shareholders, with a capital of 112,000 francs, and had during the year 1864 had a discount business to the amount of more than 542,000 francs. The Society of "Le Crédit au Travail" has by its advances and its counsels greatly contributed to the creation of other associations of "production and consumption," of which there are about thirty at Paris alone, nearly all in a flourishing condition. Besides these, within the last few years about forty societies of "mutual credit" have been established. A work recently published ("Le Crédit Populaire, par A. Balbie") shows that thirty-one of these societies, which at the outset had but 484 members, now reckon 1,430, of whom 834 are workmen in the receipt of wages. The movement has not been confined to Paris; a Society of "Crédit au Travail" has been created at Lyons; a people's bank at Colmar; a society of consumption works successfully at Havre, and many other instances might be quoted. In short the movement is at the present

time daily gaining ground and taking root, thanks to the good principles on which it works and which form a marked contrast to what took place in 1848. The present state of the law in regard to co-operative societies is, however, very unfavourable to their success and development; and the determination of the Government to introduce certain reforms in the legislation respecting commercial societies in general is received with satisfaction. Indeed, it seems to be a wise determination, and one which may produce good results in the condition of the working classes, as they will be encouraged to contract habits of order, prudence, and regularity, which have hitherto been much wanting amongst the masses in France, and whose absence has led to the frequent disturbances of the public peace which the country has so greatly suffered from during the last sixty years.

The French Government appears to be advancing resolutely in the path of commercial liberty on which it entered in 1860. Measures in accordance with the liberal programme then adopted by the Emperor are again being submitted to the Legislative Chambers, such as the bills for the decentralisation of the administrative powers, and for the extension of the action of the Provincial and Municipal Councils; for the abolition of imprisonment for debt; for the liberation of accused parties on bail (and even without) in criminal as well as in civil cases; for the introduction into France of the system of cheques; for the development of primary instruction; and for the extension of liberal principles in regard to the navigation laws. On these questions, which, with the exception of the last-mentioned, are principally of local interest and of obvious advantage, I shall not dwell. The question of the reform of the navigation laws I reserve for a future occasion.

The French Government may well be encouraged to persevere in the course of commercial liberty, by the good results which the measures adopted in this sense have already produced. It is now satisfactorily proved that French commerce has continued to increase and develop itself to a great extent under the liberal régime introduced by the Emperor. For example, the amount of the imports rose to 2,480,000,000 francs in 1864, showing an increase of 54,000,000 over 1863, and of 282,000,000 over 1862. It is true that in 1861

the amount of the imports reached 2,442,000,000 francs; but we must not forget the large importation of grain which was found necessary during that year on account of the bad harvest, and which absorbed no less a sum than 390,000,000 francs; whereas in 1864, after two good harvests, the importation of corn was limited to 29,000,000. Deducting the item of corn from the imports of 1861 and 1864, the result is, total imports for 1861, 2,052,000,000 francs; for 1864, 2,451,000,000 francs, or an increase in favour of 1864 of 399,000,000 francs.

Among the articles imported during the year 1864 cotton takes the first place as regards the value, which amounted to 315,000,000 francs. In 1863 the value of the cotton imported to France was 262,000,000 francs, and in 1862 only 126,000,000 francs. It is worthy of remark that the increase of the imports of the article cotton directly from the United States is still comparatively very small, and only augmented in a very moderate proportion in 1863, and that the indirect imports of cotton by way of England have considerably diminished. It is to purchases made directly from Egypt and India that the augmentation observable in the cotton imports to France during 1864 is mostly due. The following Table gives the amount and origin of cotton imported during the last three years to France:—

COTTON IMPORTS TO FRANCE.

Country from whence.	1862.	1863.	1864.
	Kilogrammes.	Kilogrammes.	Kilogrammes.
England	24,366,785	27,197,664	25,149,017
Belgium	93,092	93,126	159,062
Turkey	3,954,482	7,043,151	8,119,378
Egypt	4,496,581	7,915,460	12,231,822
British India	3,055,518	9,382,824	12,661,398
United States	295,343	254,218	261,296
Other countries	2,569,256	3,613,322	8,352,088
Total	38,831,057	55,499,765	69,834,061

It is probably to this revival of the cotton imports that we must attribute the falling off apparent in those of wools, which had risen from 169,000,000 francs in 1861 to 185,000,000 francs in 1862, and 224,000,000 francs in 1863, whereas in 1864 they scarcely exceed

222,000,000 francs. The same remark applies to silk and waste, of which the imports were, in 1861, 184,000,000 francs; in 1862, 236,000,000 francs; 1863, 290,000,000 francs; and in 1864, 247,000,000 francs.

These facts seem to indicate that, in proportion as new cotton markets are opened and the scarcity of cotton diminishes, the more expensive substitutes which had been found for it at the commencement of the American war are gradually resuming their original station in the market. On the other hand, the less expensive substitutes, whose importation had been greatly increased by the cotton crisis, continue to augment. For instance, the imports of jute amounted to 8,311,000 francs in 1864, having only been 4,559,000 francs in 1863. The importation of hemp amounted to 4,110,000 francs in 1863, and to 9,346,000 francs in 1864, and that of flax increased to 76,809,000 francs in 1864 from 50,551,000 francs in 1863.

But it is especially in the exports that we see the happy influence of the new system of commercial liberty. The exports of French produce rose, in 1864, to 2,900,439,000 francs, having only been in 1863, 2,642,559,000 francs; in 1862, 2,242,681,000 francs; and, in 1861, 1,926,260,000 francs, which result gives, in the space of four years, an increase of 983,000,000 francs, or nearly 50 per cent. A fact such as this requires no comment. I will only observe that it is especially the tissues of various kinds whose exportation has so considerably increased; and comparing the figures for 1861 with those of 1864, we find that these exports have augmented in the following proportion :—

Tissues.					1861.	1864.
					Francs.	Francs.
Silk	332,891,000	384,521,000
Wool	187,999,000	354,949,000
Cotton	56,347,000	84,063,000
Flax or hemp	14,872,000	22,692,000

Among the other articles whose exportation has considerably increased since 1861, I will further quote :—

				1861.	1864.
				Francs.	Francs.
Fancy cabinet work	85,000,000	175,000,000
Millinery	77,852,000	111,640,000
Wines	196,000,000	253,000,000
Refined sugar	42,000,000	67,000,000
Chemical products	28,185,000	40,309,000
Wools	21,000,000	54,000,000
Resins (home)	7,000,000	36,000,000

On the whole it may safely be asserted that the year 1864 was not a bad one for French industry and commerce, notwithstanding the pressure still created by the American war ; a pressure which we may now at length hope to see removed.

With regard to the commercial relations between France and England alone, the year 1864 shows a decrease in the imports (to France) from 469,000,000 to 414,000,000 francs ; whilst the exports from this country to Great Britain increased from 681,000,000 to 762,000,000 francs as compared with the preceding year. The following Tables, extracted from the Report on the situation of the Empire, give the details of the English imports to France, and of the French exports to England :—

Description of Merchandise.	1864.		1863.	
	Quantities.	Value.	Quantities.	Value.
Goat's-hair yarns	Francs. 5,106,000	167,000	Francs. 4,348,000
Tissues of cotton..	..	7,162,000	..	6,446,000
" wool.	23,385,000	..	23,106,000

These figures prove at least two things. First, that the French manufacturers were wrong to be alarmed at the prospect of the "invasion" of English products which it was affirmed would be the effect of the Commercial Treaty; and, secondly, that Great Britain has also reason to be satisfied with the results of the Treaty, inasmuch as it has facilitated the importation of those French articles of which she stood in need, as is proved by the increasing amount of French exports to England. If the importation of English products to France is inferior to the exportation of French products to England, there is no more reason for alarm or surprise than is felt here at the result of the Belgian Commercial Treaty, which has been, on the contrary, to increase the imports more considerably than the exports. Thus, in 1864, the imports from Belgium to France amounted to 265,000,000 francs, whereas the exports from France to Belgium were only 225,000,000 francs. Compared with the year 1862 there is an increase of 35,000,000 francs as regards the imports, and only of 20,000,000 francs as regards the exports.

Whilst French commerce is, under the new liberty it enjoys, making rapid strides, we cannot say as much of the mercantile marine, which is still under heavy restrictions. The French flag still continues to take an inferior part in the general movement of French navigation, that is to say, the share of the French flag in this navigation still continues to be far less than that of foreign flags. The following Table gives a Return of the entrances to and the clearances from French ports during the last three years, and the share of the French flag in the same:—

1.—VESSELS ENTERED FRENCH PORTS.

Year.	Total Number of Vessels.	Tonnage.	Vessels under French Flag.	Tons.
1862	28,822	4,566,673	12,374	1,907,897
1863	28,821	4,560,795	12,038	1,919,301
1864	28,400	4,662,791	11,880	1,952,093

2.—VESSELS CLEARED FROM FRENCH PORTS.

Year.	Total Number of Vessels.	Tonnage.	Vessels under French Flag.	Tons.
1862	19,205	3,005,969	8,201	1,445,872
1863	20,407	3,171,678	8,771	1,327,205
1864	20,261	3,230,088	8,717	1,506,495

There is accordingly a total diminution of 378 vessels in the number of vessels entering French ports, and this diminution falls exclusively on the French flag, of which the number is less by 455 vessels, whilst there is an increase of 77 vessels under foreign flags.

On the other hand, of vessels clearing from French ports there is an increase of 1,056, of which the French flag takes 516, or about half.

The development of the railroads in France is still on the increase. In 1864 the total length of the lines open for traffic was increased by 1,043 kilomètres. The whole *réseau* of the railroads of the Empire now embraces a total length of 20,881 kilomètres, of which 13,057 kilomètres were open for traffic on the 31st of December last, thus leaving 7,800 kilomètres to be constructed. The expenses already incurred by the Companies amounted at that date (31st December, 1864) to 5,530,000,000 francs, and the estimate of the expenses they will still have to meet amounts to about 2,130,000,000 francs. To this we must add the expenditure contributed by the State, and amounting to about 975,000,000 francs. The State is further engaged for the amount of 75,000,000 francs to various minor Companies, and by the Conventions of the 11th June, 1864, the State is also bound to the six great Companies for subventions amounting to about 396,000,000 francs, but payable in instalments which will extend over a number of years. Previous Conventions have, as we know, bound the State to the same six great Companies for a guarantee of interest, the figure of which threatens to increase year by year. When these Conventions were discussed in 1859 in the Chamber, it was attempted to make people believe that the guarantee of interest would only impose a moral and not a material obligation on the Government. The result is, that this guarantee already figures in the Budget for 1866 as an item amounting to 31,000,000 francs. In previous Reports I have ventured to express my opinion that such would be the result.

(Signed) W. G. GREY.

Prussia.

*Report by Mr. Lowther, Her Majesty's Secretary of
Embassy.*

Mr. Lowther to Lord Napier.

My Lord,

Berlin, July 13, 1865.

IN conformity with the existing regulations, I have the honour to make to your Excellency herewith my half-yearly Report upon the trade and commerce of Prussia.

The reports of the different commercial communities in Prussia upon the trade of the previous year are not made, or, at any rate, not published, till the new year is considerably advanced. I find repeated in most of them the same remarks, viz., that trade in general suffered from the Danish war, and the consequent blockade of the Prussian ports, from the civil war in America, and that native agricultural produce suffered from the remarkably bad season of 1864.

I have the honour to inclose herewith a condensed Report on the trade in 1864 at Elbing, Dantzic, Tilsit, Swinemünde, Hirschberg, Solingen, Stolberg, and Berlin, which may be of interest.

The Reports of the commercial bodies in general contain expressions of satisfaction at the conclusion of the Treaty of Commerce between France and the Zollverein, which came into operation on the 1st of this month; the conclusion of this Treaty, as well as of that between Great Britain and the Zollverein, and between Austria and the Zollverein, and between Belgium and the Zollverein, may be taken as the great commercial events of this year.

Inclosure No. 2 is a comparative statement of the receipts of the Zollverein in 1863 and 1864, in the first three quarters, and then in the whole year, showing a decrease in the whole amount of dues (import and

export) of 1,205,766 thalers (180,864*l.*); the articles in which there was a falling-off of duty levied are noted.

The Zollverein receipts from export and import dues in the first quarter of 1865 show a decrease, as compared to the same period in 1864, to the amount of 170,240 thalers (25,536*l.*); 1863 was particularly favourable to commerce, owing to the early opening of the navigation.

Thinking it might be of interest, I have added a list of the amount to which certain articles have been exported from the Zollverein to Belgium in the years 1862, 1863, and 1864, showing an increase during that period in all the articles named, with the exception of iron, silk, and window-glass.

As sugar made from beet-roots is one of the great articles of manufacture and trade in Germany, and more particularly in the north of Germany, I inclose two Tables, which give the number of factories employed, the amount of population of each State of the Zollverein, the amount of beet-roots consumed, the amount of duty paid, and the share to be paid or received by each State of the Zollverein during the period from the 1st of January to the 31st December, 1864.

Inclosure No. 6 contains a detailed account of the amount of duty paid on beet-roots and sugar in the Zollverein from the 1st of April, 1864, to the 31st of March, 1865; and Inclosure No. 7 is a comparative statement of the annual Customs receipts in the period from 1845 to 1863 from foreign sugar imported, from beet-root sugar manufactured, and declared value of sugar exported, which show a considerable decrease of import duty, an increase in the duty on beet-roots, and an increase in the receipts from duty and tax to the amount of 642,223*l.*, in 1863, as compared to 1845.

I have further the honour to inclose herewith a Table, giving the amount and division of duty paid upon brandy in the Zollverein in 1864; the amount and division of transit dues upon beer in the Zollverein in 1864; the produce and division of the transit dues from wine, must, and tobacco in the Zollverein in 1864; a comparison of the receipts from dues in Schleswig and Holstein in 1863, 1864, and 1865; a Table showing the business done in the Postal Verein

in 1863; the amount of wool sold, and the prices paid for it, at the wool markets in Prussia in 1864; the yield of harvest in Prussia in 1864 as compared to that of 1863.

With regard to the prospects of the harvest for the present year, I have to state that they are generally bad in the north of Germany, owing to the spring having been very late, to the want of rain while the corn was growing, and to the very warm weather in May, which too rapidly succeeded the winter; potatoes, however, will be very abundant, and are healthy.

The statistics of the amount of minerals and of coal produced in Prussia from the year 1854 to 1863 show a steady increase in the amount produced. There has been at the same time an increase in the amount of coal imported exclusively from Great Britain. In 1859 the amount imported was 191,775 tons, in 1863 it was 262,777 tons, at Stettin; at Danzig, in 1852, it was 41,141 tons, and in 1864 it was 110,443 tons. In Westphalia the amount of coal produced was, in 1862, 28,551,177 tons, in 1863 it was 31,550,083 tons. Westphalian coal is very much exported to Holland; Rhenish coal is exported in large quantities to France; Belgium exports as much coal as it imports from the Zollverein. There is no doubt that in course of time the coal-pits and fields in Prussia will become very profitable, but at present the coal trade suffers from the high rate of freights charged for its transport on most of the railways and from the deficient means of transport by water.

With regard to the development in production of coal I find that, in 1857, 47,363,716 Prussian tons were obtained, valued at 23,453,340 thalers (3,518,001*l.*), from 503 mines, at which 64,754 workmen were employed; in 1863, 71,654,578 Prussian tons, valued at 23,361,065 thalers (3,504,159*l.*), were obtained from 417 pits, at which 71,592 workmen were employed. Great use is made in Prussia of brown coal (Bovey coal), which is found in many parts of the country.

I have added a précis of the Report of the Committee of the Second Prussian Chamber upon the Budget of Prussia; information relative to the statistics of the Prussian Bank; detailed statistics of the railways in Prussia in 1863, and of the number of

vessels which arrived at and sailed from Prussian harbours in 1864 as compared to 1863, showing a considerable decrease in 1864; as well as a Table showing the total number of vessels which left Prussian ports in 1864, the countries from which they came and the number of lasts; statistics of the number of Jews in Prussia, amounting to 253,457.

Reports having reached Berlin in 1864 of a malady coming from Russia, affecting men and cattle, called the "boil plague" (in Russian the Siberian "jaswa"), the Minister of Education and Medical Affairs thought it advisable to send veterinary surgeons to Russia to make a report upon the subject, the malady called "meningitis" having been erroneously connected in the mind of the public with the "jaswa." I have translated the Report of the Prussian veterinary surgeons, in which it is stated that in 1864 from 70,000 to 100,000 horses were killed by this disease in Russia.

During the last two years some alarm was created at Berlin and other parts of Prussia by the appearance of a disease in pigs called "trichinen;" the disease consisted of an accumulation of very small worms in the flesh of human beings and animals. All kinds of swine flesh were affected by it, and were consequently avoided. I have the honour to inclose an account of an experiment made at Berlin and Halle with regard to the transplanting of "trichinen." The malady has very much diminished this year.

I have, &c.

(Signed) W. LOWTHER.

(No. 1.)—*Report on the Trade in 1864 at Elbing, Danzig, Tilsit, Swinemünde, Hirschberg, Solingen, Stolberg, and Berlin.*

Elbing.—THE year 1864 was altogether unfavourable for commerce and trade, particularly on account of the Danish war. The fall in the corn prices and the money crisis spreading from England all over Europe increased the existing calamity considerably, and made themselves felt in all the branches of commerce.

Corn Business—in 1864 could not recover from the

depression of the preceding year. The results even fall short compared with those of 1863. The continual wet weather and low temperature during summer and autumn did much harm all about this place. The crop was of middling quality; and though the quantity was large enough, still the corn-merchants having realized little or no profits in the last years, and considering the good harvest in other countries, had to operate with great caution. There were exported:—

		By Sea.	By River.	Together.	In Store.	
					End of 1864.	End of 1863.
		Lasts.	Lasts.	Lasts.	Lasts.	Lasts.
Wheat	..	1,046	742	1,788	2,604	1,507
Rye	..	1,655	1,085	2,740	1,403	574
Barley	..	21	349	370	237	197
Oats	..	63	22	85	44	205
White Peas	..	{ 22	69	91	{ 56	59
Grey Peas	..				{ 6	29
Tares	11	11	2	19
Beans	5	4

Spirits.—The price remained low— $12\frac{1}{8}$ to $12\frac{3}{8}$ rix-thalers per 8,000 per cent.—till May; then it gradually rose, and reached in June and July, $15\frac{3}{4}$ to 16 rix-thalers; upon which it went down again, and was at the end of the year, $12\frac{1}{2}$ rix-thalers. Spirit and liquor manufactories worked the whole year with unaltered activity.

Wool.—3,974 cwt. passed the warehouses. Prices were per cwt. :—

					Rix-thalers.
Prime fine wool, up to	80
Middling fine	65 to 68
Middling	60 to 63
Ordinary	40 to 45

Timber.—The extremely low prices of all the produce of the country, as well as the inconsiderable export from Dantzic, have had an essential influence upon the timber business of Elbing, and made prices very dull, though sellers from Poland brought down good wood, and did not reduce their quotations, generally succeeding in getting last year's prices.

Construction of Machines.—The establishments em-

ployed 700 to 800 workmen. The erection of a new establishment for the construction of iron ships and machines is expected. All the firms got a considerable number of important orders, even as far as from Silesia and Russia. An order for Austria could not be executed on account of the high duty for entering that country.

There were manufactured at Elbing in 1864—

- 1 iron steam dredging machine, 16 horse-power.
- 1 " " 25 "
- 1 wooden " 16 "
- 1 iron towing steam-boat 16 "
- 1 steam engine of 50 horse-power, with boiler and iron-sledge for dredging machine.
- 2 steam-engines, 20 and 12 horse-power.
- 1 screw-machine with boiler, 12 horse-power.
- 3 Woolf's steam-engines with boilers, together 64 horse-power.
- 4 Woolf's steam-engines with boilers, together 26 horse-power.
- 1 lying high-pressure machine of 10 horse-power.
- 23 locomobiles.
- 5 large boilers for ships.
- Sundry boilers for distilleries and other establishments.
- 6 steam-mills for sawing timber.
- 8 steam-mills for grinding corn.
- 548 threshing machines.
- 373 machines for cleaning corn.
- 642 machines for making chopped straw.
- 4 stationary engines.
- 47 sawing machines.
- 10 machines for digging peat.

The manufacturers used of material—

- 21,800 cwt. of raw iron.
- 10,200 cwt. of forged iron.
- 336 cwt. of copper and brass.
- 425 lasts of coals.
- 227 lasts of coke.

Tobacco.—The last year was not favourable for the manufacturing of this article. The other manufacturing factories worked as usual.

Rags—24,000 cwt.; *Bones*—18,000 cwt., were exported.

Navigation.—There arrived at Elbing in 1864—

By river	755 vessels.
By creek	233 "
By the Overland canal..	1,426 "

There left Elbing—

By river	258 vessels.
By creek	453 "
By Overland canal	1,383 "

Railway Traffic.—Elbing received in 1864, 309,156 cwt. of goods, and sent off 234,869 cwt.

Dantzic.—The export of corn and timber is still the chief branch of the business of this place. Only a throwing open of the Polish and Russian frontiers can heal the wounds given to the commerce of Dantzic by the Danish war. To the falling prices, to the money crises spreading from England and driving up there the interest to 9 per cent., and to the Danish war, is to be ascribed the decrease of the export. There left this harbour 2,211 ships, with 241,847 lasts, compared with 3,065 ships, with 307,965 lasts in 1863. The value of the export and of the import also decreased considerably.

The import was lower by 1,150,000 rix-thalers, and the export by 6,300,000 rix-thalers, compared with 1863.

The Corporation of Merchants have again expressed their wishes for the regulation of the bed of the River Vistula; for the abolishing of the duties against Poland, being almost prohibitive; and for a greater development of the railways in the eastern provinces of Prussia. A line from Coeslin to Dantzic seems to be particularly desirable, but in order to pay would have to be built in its whole length together, and not by little bits. It is to be lamented that the small branch line, Dantzic-Neufahrwasser, has not yet been built. The construction of a dock at that place is also necessary, but no steps have yet been taken towards constructing it. The want of sufficient bonding warehouses showed itself very much again during 1864.

The Export of Grain in 1860 was the largest ever since 1849, but it has increased since continually. It amounted in 1860 to 100,000 lasts; in 1861, to 113,000 lasts; in 1862, to 136,000 lasts; in 1863, to 130,000 lasts; and in 1864, in spite of the blockade, to 105,000 lasts.

The chief export was again as usual for England. Of the 105,000 lasts mentioned above, there went to England alone 63,000 lasts, to Holland 18,000 lasts, to Norway and Sweden 13,600 lasts, the rest of 10,000 lasts to sundry other countries. Of wheat, 62,500 lasts were shipped altogether; of which 52,000 lasts went to England. Prices rose during the blockade

from 66 and 67 silvergroschen per scheffel to 71 and 72 silvergroschen, but fell after the same down to 64 silvergroschen. The harvest of 1864 is not good. Of rye there was less import and export than in 1863, say 20,000 lasts. Of the 30,000 lasts exported, 12,700 lasts went to Sweden and Norway, and only 9,600 lasts to Holland. Prices ruled at the beginning and end of the year 36 and 37 silvergroschen per scheffel, in the middle of the year 41 and 42 silvergroschen. Barley, 3,000 lasts were exported, chiefly to England, price 33 to 35 silvergroschen per scheffel.

TABLE showing the Stores, Imports, and Shipments of Corn, Peas, Beans, and Seeds in 1864.

[In lasts of 60 scheffel.]

The renewal of the Zollverein Treaties in the past year has not justified the expectations of the merchants. The high duties upon the most necessary and indispensable kinds of food of the population, such as coffee, rice, and sugar, are still continued, and the petitions of the Corporation of Merchants have not been considered at all as to the sugar duties.

Raw Cotton.—1,259 cwt. were imported against 2,440 centners in 1864. The greatest part of this import was for Poland, and only an inconsiderable quantity was left for inland consumption, which consumption, on account of the high prices, was reduced to a minimum.

Amber.—The quantity got of it in the past year has not been so large as that picked up at the Kurische Nehrung. Prices did not go down, as considerable quantities were sent to Constantinople, the Orient, and to Vienna. From China also a demand had to be met again, and was met, as the sorts current there were easily to be had. The quantity of amber waste, useful for the preparation of sealing-wax and varnish, was the same as last year; the export, however, was reduced to a minimum. The business in English and Leghorn bastard corals for the Levant and Africa was very lively, but no orders came from America for cut corals. The stores of amber at the close of the year were pretty considerable, but are all in firm hands; therefore no reduction of prices is to be expected. Quotations of prices of this article would be of no interest on account of the extraordinary variation of same according to the different quality.

Spirits.—Business confined itself to the consumption on the spot and to the Eastern Provinces of Prussia. No export to other parts took place.

				Ohm.
The total import amounted to				24,600
Against 22,400 in 1863.				
In hand, end of 1863				2,800
				<hr/> 26,900
Exported to the Rhenish Provinces				850
" East Prussia				11,150
Consumption				12,500
				<hr/> 24,500
In hand, January 1, 1865				2,400
				<hr/> 26,900

The value of the export amounts to 160,000 thalers.
The average prices were—

					Thalers, per 8,000 per cent.

Fat	1,680	—
From Holland—					
Fat	110	216
From Prussian Coast				360	—
Total				80,994	83,235

The 80,994 tons imported represented a capital of 708,000 thalers.

There were on store, end of December 1864—

Crown and full	4,200 tons.
Lower quality	2,100 „
Norwegian	850 „
Together					7,150 tons.

The results of the business of the expired year were favourable for the parties engaged.

Timber.—Business in this article has been hurt most severely by the Danish war, and this war is the only cause that the export of 1864 falls short of that of 1863. There were exported 1863, 1,177 cargoes, value 5,310,000 thalers; 1864, 848 cargoes, value 3,555,000 thalers. The disadvantages caused thereby to the houses engaged in this branch were considerable.

Whilst the export as shown was smaller than in 1863, the supply of timber was altogether larger. The stores were, therefore, a good deal more considerable at the end of 1864 than at the end of 1863. This increase of supply was caused by the circumstance that a quantity of timber that had been kept back by the low water of the Polish and Gallician rivers in 1863 arrived in 1864, the summer of which year was altogether more favourable for floating goods.

The telegraph charges were reduced. An increase in the number of telegrams sent and received was the natural result :—

		1863.	1864.	More.
There were sent	..	19,305	22,782	3,477
There were received	..	20,581	25,263	4,682

Navigation of the rivers.—There arrived by river :—

1864	3,061	vessels and 190	steamers.
1863	4,123	„	191 „
1864	1,778	rafts of timber.	
1863	1,472	„	

The crew and men on all these vessels and rafts consisted of 9,467 Prussians, 1,342 Poles, 1,462 Russians, 9,752 Gallicians, making a total of 22,023.

The height of the water in the Vistula and in the rivers falling into it was in the past year exceptionally favourable.

The fact of the number of river vessels that arrived in 1863 exceeding that of 1864 is to be attributed in the first place to the high water enabling them all to take full cargoes, and then more particularly to the fact that about 8,000 lasts of grain were sent from Poland by railway in the first months of the year.

Tilsit.—Hardly ever was a year so bad for this place as 1864, both as regards political embarrassment and the influence of the weather. The latter disappointed the hope of Tilsit to have the railway line to Insterburg opened, which will not be the case before the middle of 1865. Endeavours are being made to carry it on to Memel, the parishes through which it cuts having offered the land gratis.

The merchants ask for a reduction of the Tariff for postages and telegrams.

Russia has abolished her export duties on corn, linseed, &c.; but the import duty of Prussia still exists, though it causes much annoyance and yields little for the finances of the State.

The new Tariff of Customs agreed upon in the Commercial Treaty with France will be partly adopted

by the 1st July, 1865. The merchants think it desirable it should be adopted altogether at that date.

Spirits.—Business in this article has gone back since the suppression of the Polish Revolution to its former modest dimensions. There were in store, say 800 ohms, and the total supply amounted to 8,000 to 9,000 ohms.

Wool.—The dull state of business in 1863 effected a similar one in the beginning of 1864. The favourable result of the English sales by auction, however, in March and April raised a demand, and Berlin houses concluded here delivery contracts: circa 200 cwts. were sold at the beginning of May at 63 to 68 thalers per 106 lbs.; other 150 cwts. followed. 160 cwts. were sent to the Königsberg market, where prices were 5 thalers lower. Of the second shearing, circa 150 centners were collected, which fetched at the beginning circa 40 thalers, but afterwards, in consequence of the high cotton prices, 50 to 60 thalers. The wash was generally speaking pretty good.

Coals.—The demand for the manufactories, the gas-works, railways, steamers, and artisans was covered for the greatest part direct from England, and Scotland via Memel, or from the stores at the latter place. Prices were essentially higher than in former years, as coal was dearer itself and the freights besides were very high all the year, in consequence of the Danish war. Prices were, Newcastle machine coal 16 to 18 silver groschen, Scotch ditto 14 to 16 silver groschen, and small coal (nut coal) 15 to 16 silver groschen per ton of 2 scheffels; they rose at the end of the year, on account of insufficient supply, up to 25 silver groschen. The consumption amounted altogether to 100,000 tons of 2 scheffels.

Cattle.—For consumption:—

Oxen	1,092
Cows	1,662
Pigs	4,280
Calves and sheep	6,124

From these were got 1,870 cwts. of tallow, 188 cwts. of grease.

There were exported to Memel, Königsberg, and Berlin:—

Oxen and cows	682
Milch cows	264
Pigs	1,184
Calves and sheep	580
Smoked meat	cwt. 3,364

Prices were, for an ox, 68 thalers; for a milking cow, 44 thalers; for another cow, 38 thalers; for pigs, 18 thalers; for calves, 6 thalers; and for sheep, 4 thalers. Prices of meat were, for beef, 3 silver groschen; pork, 3 silver groschen; veal, $3\frac{1}{2}$ silver groschen; mutton, 3 silver groschen; for smoked meat, 4 silver groschen; for raw tallow, $2\frac{3}{4}$ silver groschen; for purified tallow, $3\frac{1}{2}$ silver groschen per lb.

Swinemünde.—During the last three years arrived at this port:—

The difference between 1862 and 1863 is, particularly in the number of lasts, very small, but enormous between 1864 and either of the two former. There have been less in 1864 than in 1863.

			No.	Lasts.

Coals.—The import of English coal and coke into Swinemünde amounted to—

In 1862	1,919,190 cwt.
1863	2,126,670 "
1864	680,880 "

that is, 1,238,302 cwt. less than in 1862, and 1,445,790 cwt. less than in 1863.

From Swinemünde went to Stettin—

1863	3,207,966 cwt.
1864	1,373,818 "
Decrease in 1864	1,834,148 "

Of all the ships arriving here, discharged their cargoes at the place—

					Ships.	Lasts.
1862	343	60,699
1863	413	69,075
1864	183	31,190

There remained, therefore, at Swinemünde (coasting vessels excluded), 1862, 21·80 per cent.; 1863, 24·68 per cent.; 1864, 20·01 per cent. The cargoes discharged at Swinemünde consisted chiefly of coal, coke, and raw iron. French ships were comparatively more frequently seen on account of their having been put temporarily on the same footing with the favoured nations during the Danish war.

Navigation at Swinemünde was closed by ice on the 12th December, 1864.

Hirschberg and Schönau. Linen Manufacture.—The first half of last year gave hopes that the improvement it had experienced would be a lasting one, but the second half disappointed this expectation altogether. The reduction of the cotton prices threw down the linen prices, so that manufacturers could not even sell at a great loss. Besides a great many merchants in this line had to suspend payment, and no money could be got out of Russia on account of the most unfavourable course of exchange. The fabrication of cotton is altogether influenced by the English market. The constant variation of prices confused consumers, and restricted the demand. The cotton yarn manufacture did not do well at all for the same causes.

Turkish Carpets.—400 were made at Schmiedeberg against 500 in 1863, but those of 1864 had as a whole a larger surface. Similar goods were also made. The material used altogether amounted to circa 290 cwt. of Serbian and Syrian wool, 680 cwt. of jute and Manilla wool. 125 men on an average were daily employed: the pay for men was 2 to 3½ thalers; for female labourers, 1¼ to 2 thalers a-week.

Lace.—The manufacture of Brussels and Valenciennes lace did well.

Champagne.—The fabrication has remained in its former extent.

Solingen.—The expected improvement has not taken place. Not alone North America, but other markets too took nothing this year of the steel wares. Business with the Brazils was lively in the beginning, but the unfavourable course of exchange and the money crisis that broke out there put a stop to all further transactions. The most important branch are steel goods.

The La Plata States did not come at all to this market, having been an important customer formerly. The West Indies came only in the first half of the year. Mexico has improved since the establishment of the Empire. The West Coasts of South America and Africa took very little; the East Indies remained stationary. The Levant is a regular customer. Egypt took larger quantities than usual during the high cotton prices, but left off again afterwards. Spain and Portugal took less than in former years. Italy buys more than before, particularly a sort of ordinary pen-knives. The demand for the Orient and the Principalities was only lively during the first half of the year. Business with Poland and Russia was stopped altogether. Sweden, Norway, and Denmark did not take much, and business was interrupted by the Danish war. The Zollverein consumed regularly; the Eastern Provinces of the Zollverein, however, least of all.

Arms.—Steel arms were dull altogether; only few orders have been given by other Governments, not at all as many as this place is accustomed to. There are better prospects for the business of 1865. The Russian Government has ordered a considerable quantity of Cavalry swords: the Brazilian Government has also ordered a quantity of Cavalry swords and of bayonets; the Prussian Government has contracted for a considerable number of Infantry swords, and the English Government intends, it is said, to order a large quantity of bayonets.

Crinoline Hoops.—The demand was not smaller than in 1864, but complaints are made that prices go down lower and lower.

Sugar Forms.—Business lively on account of a number of new refineries having been established.

They are also exported to England, though iron is cheap there, which proves how well these things are made here. In the Commercial Treaty with France this article has not been considered enough. Business would have been livelier still if not, by several refineries being given up, circa 100,000 old forms had been thrown into the market.

Cotton and Half Wool.—Manufacture of the former is decreasing; of the latter increasing, and not enough workmen to be had.

Stolberg.—*Coal Mines* were worked actively all the year round, and though nearly all the mines yielded more in quantity than last year, still the great demand caused the price to rise. The production in the mining district of Düren amounted to—1862, 3,619,218 tons, Prussian, value per ton $14\frac{1}{2}$ silver groschen; 1863, 3,698,986 tons, value $14\frac{1}{2}$ silver groschen. The mines of the Eschweil Union, to which, since 1863, also the mine Anna, near Alsdorf, belongs, yielded, in 1864, 7,558,487 scheffels against 7,024,299 scheffels in 1863; therefore, in 1864, 534,188 scheffels more than in 1863.

Of coke there was obtained from the pits Centnum and Anna, in 1864, 499,181 centners; in 1863, 434,109 centners; showing an increase in 1864 to the amount of 65,072 centners. Coal and coke found a ready sale, and more could have been obtained had there been a sufficient number of hands.

At the coal pit of Maria, at Hünen, there were obtained in—

1864	2,601,140 scheffels
1863	2,227,793 „
Increase in 1864					373,347 „

There were produced 216,435 centners of coke, and 210,000 in 1863.

At James Grube there were produced—

					Centners and Scheffels.
In 1864	1,044,710
1863	965,476
Increase in 1864					79,234

The amount of raw iron made at the coke and charcoal forges in the district of Aix-la-Chapelle was in 1862, 484,111 centners; in 1863, 505,963 centners. The smelting works of the Company (Concordia)

produced, in 1863, 30,350,910 lbs.; in 1864, 33,394,131 lbs. The Forge Company of Mathé Hösch and Co., at Atsch, at Stolberg, produced, in 1863, 15,289,640 lbs.; in 1864, 14,704,000 lbs.

The import of foreign raw iron, by Aix-la-Chapelle and Emmerich, was—

					Centners.
In 1863, by Aix-la-Chapelle	152,206
„ Emmerich	989,639
Total	1,141,845
<hr/>					
In 1864, by Aix-la-Chapelle	49,154
„ Emmerich	869,328
Total	918,482

Showing a diminution of the import of 223,363 centners.

The produce of bar and rolled iron, and rails, was, in the district of Aix-la-Chapelle, in 1862, 671,174 centners; in 1863, 654,633 centners.

Of silver there was produced, in 1862, 8,886 lbs.; in 1863, 7,506 lbs.; in 1864, 9,345½ lbs.; which represent a value to the amount of 280,372 thalers.

Berlin.—In the Report of the Commercial Body at Berlin, which is published every year, it is stated that the trade, and more particularly commercial undertakings, suffered more from the fear of the war with Denmark spreading than from the actual war itself.

The war in America had a depressing effect upon trade. In the first quarter of 1861 the import of raw cotton into the Zollverein amounted to 1,351,551 centners; in the same period in 1864 it was 654,603 centners. Added to these disadvantages were the money crisis in Europe, and the high rates of discount.

The imports of corn to Berlin were more than usually large, owing to the export being put an end to by the Danish blockade; and the export of spirits also increased. Less coal was imported into Berlin than in 1863, and more native coal was used in consequence. Trade in iron and metals was similar to last year. Wrought-iron works and factories for making machines found employment enough for the railways at home and abroad, for artillery uses and building purposes, and for agricultural and industrial purposes.

The wool trade had the extent of the last three

years, but there was no improvement in the price. The consumption of trammel and carded yarn increased; the manufacture of woollen and half-woollen stuffs was greater than usual, as was also that of cloths and shawls. The cotton manufactures occasionally found a ready sale to Poland and Russia. Made-up silk wares found a sale in Southern Germany and Holland and Switzerland; there were smaller quantities than usual sent to Poland and Russia. With the month of May the prices rose of the silk manufactures, owing to the high price of the raw material.

With regard to the export of manufactured goods, it ceased almost entirely as regards America, but increased to the East and China.

Since the 12th of October, on which day Bavaria, Wurtemberg, the Grand Duchy of Hesse, and Nassau, acceded to the Treaties of the 28th June and 11th July, the Zollverein crisis was at an end. The Zollverein, by means of these Treaties, entered upon a new period of existence for twelve years, from the 1st of January, 1866. The reform of the Zollverein Tariff was completed, and all the members of the Zollverein acceded to the Treaty with France of the 2nd of August, 1862. According to the new arrangement of the Tariff there have been some duties done away with, and some reduced. The results of the changes in the Tariff are looked forward to with confidence, as the conviction exists that there need be no alarm at competition in foreign markets.

Postal Treaties with Spain and Portugal come into operation on the 1st of July. In consequence of the conclusion of a Postal Treaty with Sweden there is now a postal steam-boat communication by the Baltic. Facilities have been introduced for the transmission of telegrams in Berlin; formerly they could only be sent from one station, now they can be taken at any of the Post Office stations, and are forwarded to the General Post Office for transmission. Since the 1st January, 1864, there has been a reduction in charges for telegrams sent between Prussian and French stations.

There were good receipts from the railways. This was very much owing to the reduced freights for grain and coal. The territory of the sale of Prussian coal

has so much increased, and has now assumed such large dimensions, that the price of coal in Westphalia might easily be raised without the sale being affected. Of railroads that are about to be made, those of most importance are the direct line from Berlin to Cüstrin, that from Neustadt-Eberswalde to Wriezen, which will bring the fruitful Aderbruck into connection with the lines of railways. An English company is engaged in making a line from Berlin by Cottbus and Spremberg to Görlitz.

There was satisfactory progress in the Prussian mining and forge industry. The total value of the mineral produce obtained in Prussia was, in 1863, 34,687,218; the value of the fuel obtained was alone 27,007,889 thalers. The sale of the produce of native foundries has improved in extent, owing to the reduction of railway freights. The expense of working them has become considerably less; the prices, too, were become so reasonable that foreign goods no longer had the upper hand in the home markets. Iron goods, more particularly raw steel, are now become an article of export to England. The production of coal amounted, in 1863, to 71,724,154 tonnen.

The attention of the Government is particularly called to the state of the navigation of the Rivers Elbe and Oder. In 1853 there passed the Lock of Brieg 1,723,483 centners of goods; in 1863, only 586,547 centners. The Lock of Ohlau, in 1853, 1,681,997 centners; in 1863, only 718,285 centners. And in the same period the transport of goods on the Upper Silesian Railway rose from 8,103,793 centners to 35,228,147 centners. How great, therefore, would be the value of a good and regular water-communication for the provinces producing grain, wood, railway sleepers, coal, wrought iron, raw iron, forged iron, zinc, tin, cement, cattle, chemical produce, &c.

Amongst the subjects to which the attention of the Prussian Government is particularly called by the Commercial Body of Berlin is the advantages enjoyed by the British manufacturers of spirits of wine, as compared to the foreigners, the duty in England being so high that it entirely excludes foreign spirits from the English market.

The following is a Table of the total business of grain in 1864:—

	Wheat.	Rye.	Barley.	Oats.	Peas.	Wheat Flour.	Rye Flour.
	Wispel.	Wispel.	Wispel.	Wispel.	Wispel.	Centners.	Centners.
Stock, 1st January	480	2,936	85	960	65	16,071	17,386
Imported—							
By water ..	12,698	84,284	4,359	13,734	1,209	382,210	492,246

By railroad ..	15,430	25,560	11,421	40,456	5,747		
Stock, 31st December	28,836	118,987	18,163	65,994	7,203	398,281	509,682
	580	4,065	156	393	47	14,853	10,311
Consumed, in transit, exported	28,256	114,922	18,007	65,601	7,156	383,428	499,321

	Import.	Export.	Used.
	Wispel.	Wispel.	Wispel.
Wheat ..	28,356	11,503	16,753
Rye ..	116,051	89,200	25,722
Barley ..	18,078	9,515	8,382
Oats ..	65,034	16,371	49,230
Peas ..	7,138	3,021	4,135
Total ..	234,557	129,610	104,922

There were, moreover, imported 874,000 centners of flour, and 184,400 centners of bread.

Of the grain there were weighed 2,380,096 centners, and there were measured 312,455 centners, that is, only one-twelfth.

Owing to the good yield of potatoes in 1864, the manufacture of spirits has increased, and the business was satisfactory.

For some years there has been a regular sale to England of spirits from Berlin factories used for the adulteration of wine and brandy in bond; and it is stated that if spirits of wine were admitted into England under less disadvantageous circumstances the sale would be considerably larger. Large quantities are sent to Hamburg, Lübeck, Denmark, Switzerland, and Bavaria.

PRODUCE OF SPIRITS.

			In Prussia.	In Steuer Verein.

1st December	1,300,000	150,000	750,000	600,000
31st December	1,250,000	1,000,000	1,600,000	1,500,000

There was an increase in the amount of animals in 1864 as compared to 1863; in 1863 there were imported

of oxen 57,892, of calves 77,142, of pigs 160,972, of sheep 336,684, and these numbers were surpassed by 6,912 oxen, 7,707 calves, 23,441 pigs, 35,496 sheep; this was owing to demand for the Prussian soldiers in the Elbe Duchies.

The coal trade of Berlin in 1864 did not experience any great increase; in fact, the supplies rather diminished. The chief reason for this was the blockade of the Baltic ports; it was also partially owing to the fact that the brick or tile-makers made considerable reductions in their works.

There came into the market in 1864—

BY RAILWAY.

				At 4 Berliner Scheffel.
				Tonnen.
Upper Silesian coal	1,650,856
Lower Silesian coal	178,815
Westphalian coal	311,638
„ coke	49,405
Bohemian brown coal	253,536
Saxon coal	65,670
„ coke	2,986
Total	2,512,906

				BY WATER.
Silesian coal	24,652
Bohemian brown coal	52,809
English coal	486,716
English coke	76,798
Native brown coal	15,849
Total	656,824

There were therefore in stock and sent for consumption to the amount of 3,169,730 tonnen; as compared to 1863 there was a decrease of 172,711 tonnen.

Of English coal there were imported in 1863, 1,509,940 tonnen; in 1864 not one-third of this amount was imported, owing chiefly to the blockade. It is not improbable that even under usual circumstances the use of English coal will diminish. Native coal has been found to be very valuable in the time it had to be used. The Silesian coal has proved the best for heating and manufacturing purposes; the West-

phalian is best suited to take the place of English coal for forges. The two large gas establishments at Berlin have found that they are able to make profitable use of Westphalian and Silesian coal (Upper and Lower Silesian), and as these establishments are connected by railway with the pits from which the coals are taken, there is a great economy of time and labour in taking native coal in preference to foreign coal; native coal, too, can always be procured. The supply has till now been equal to the demand. There were imported by land 640,967 tonnen more, and by water 1,080,010 tonnen less than in 1863, owing to the Danish blockade.

The Upper Silesian is the coal most used at Berlin, and its employment has increased 20 per cent. in comparison to 1863, and it represents 50 per cent. of all the coal used. The high rate of freight by railway impedes its export to Pomerania and to the Oderbrück. On most of the German railways coals are charged 1 pfenning per mile and centner, exclusive of a charge for the truck; but on the Berlin and Stettin railway, and the other railways in connexion with it, the triple of that amount is charged.

The prices of coal remained the same till late in the autumn.

Silesian coal, ..	18½ to 19½	to 20	thalers per last of 72 scheffel.
Dice coal ..	17½ to 18½	to 19	„ „ „
Small coal .	14½ to 15	..	„ „ „

Well sifted coal in pieces were ½ to 1 thaler dearer.

At the beginning of October they were paid ½ to ½ thaler more per last. Westphalian coal was in price—

Machine coal	19½ to 22	thalers per last of 72 Berlin scheffel.
Nut coal ..	18½ to 19	„ „ „
Forge coal .	18 to 20	„ „ „
Gas coal ..	21 to 21½	„ „ „

Of Westphalian coal there were sent to Berlin more than four times the quantity sent in 1863; chiefly gas coal, and in the second place forge coal, for which purposes some Westphalian coals are better suited than the Silesian. English coal, of which 1,023,224 tonnen less were imported than in 1862, came only by Ham-burgh. Bohemian brown coal, used for heating rooms and in factories, is generally mixed with Silesian coal.

For many years there was a surplus production of coal which kept down the prices of all sorts of

coal so low that the existence of some of the pits was endangered; under the present circumstances of the demand keeping pace with the supply, and of the scarcity of labour, there cannot be any fear for some time of a return of surplus production.

There were more locomotives built in 1864 than in 1863; in the largest factory there were 134 built with tenders, of which 24 were on Russian account for the Odessa-Parkany railway; 2 for a Dutch company to India, 8 for the Lübeck-Büchen Railway Company.

The sale and use of china has considerably increased within the last few years, chiefly owing to the use of coal.

At the beginning of the year the prices of raw sugar were very high, owing to the large purchases which had been made for England and France, but they fell later in the year, owing to the large amount which had been manufactured in 1863-64, and also owing to the reduced demand for America. The amount of raw beetroots, taxed, used in making sugar, was in 1863-64, 39,911,520 centners in 253 factories, and in 1862-63, 36,719,259 centners; 1861-62, 31,692,324 centners; 1860-61, 29,354,031 centners; 1859-60, 34,339,317 centners; 1858-59, 36,668,557 centners.

In 1863-64 there were used for making 1 centner of sugar 13·2 centners of beet-roots; in the previous year for making the same amount of sugar 13·5 centners were used: so that the quality of beet-roots was better in 1863-64.

The wine trade was limited in 1864 to the consumption of the States of the Zollverein. Of wine charged with duty, there was at the Berlin Custom-house:—

French wine	19,714	centners	19	lbs.
Champagne	6,971	"	71	"
Spanish	323	"	27	"
Portuguese	491	"	56	"
Cape	9	"	75	"
Hungarian	1,567	"	30	"
Italian	106	"	39	"
Verein countries	15,726	"	58	"

The import of foreign wines as compared to 1863 diminished by 6,434 centners 65 lbs.; this was owing to the inferior quality of the French wines of 1863, and to the uncertainty which existed relative to the Franco-Zollverein Treaty. The reduction of duty by

33½ per cent., which will come into operation on the 1st of July, 1865, and the good vintage of 1864, will give the wine trade a new impetus. There was also a diminution in the import of Verein and German wines. According to the official accounts, there are 41 breweries in Berlin. The malt used in 37 of them in the period between the 1st of October, 1863, and the same period 1864, amounted to 262,737 centners. The largest of these breweries made 52,000 tonnen, of which two-thirds were disposed of in Berlin, and one-third exported. 1864 was not a profitable year for the wool trade. That this article should be in a depressed position in general, notwithstanding that the manufacture of wool is on the increase, is owing to the increased production of wool in and out of Europe. It is to be noted that the consumption does not keep pace with the production.

It is calculated that about 226,000 centners of wool was sold in 1864 at the following Prussian wool markets:—

	Very fine.	Fine.	Middle.	Ordinary.	Total.
Berlin	8,000	58,000	30,000	96,000
Breslau	3,000	16,000	30,000	6,000	55,000
Posen	10,200	11,250	950	22,400
Stettin	450	15,250	60	15,760
Lundsberg	4,500	6,500	3,500	14,500
Stralsund	6,650	..	6,650
Königsberg	3,500	1,500	..	5,000
Paderborn ..	525	500	1,000	175	2,200
Mühlhausen	400	1,000	500	1,900
Dusseldorf	75	175	250	500
Coblentz	75	375	..	450
Elbing	80	..	80
Magdeburg	225	..	225

Of this amount, the greatest part was used in the Zollverein, and only a small portion was exported. The extent to which the export has decreased may be seen from the following figures; there went from Germany to England—

In 1800, 4,200 centners = 3½ per cent. of the total imports to England.
 In 1830, 267,870 „ = 83 „ „ „
 In 1860, 33,225 „ = 2 „ „ „

But it shows at the same time how much the woollen industry has increased in Prussia. There was active supply of cloth in the early part of the year to America.

Norway, Sweden, and Holland took less; Italy and Switzerland required less. A Leipzig house had extensive orders for China and the East Indies, Owing to the introduction of Japanese silkworms, the silk trade has made some progress.

(No. 2.)—*Receipts of Dues of the Zollverein in the first three Quarters of 1864.*

The receipts from import and export dues amounted in the first three quarters of 1864 to 17,602,751 thalers: during the same period in 1863 they amounted to 18,458,893, so that in 1864 there was a deficit to the amount of 856,142 thalers. After the conclusion of peace with Denmark, the uncertainty with regard to the issue of the crisis in which the Zollverein was towards the end of the third quarter hindered the advance of trade, and the spirit of speculation was impeded by the rise in the rate of interest.

The objects on which there was a deficit of dues paid of greater importance, were raw sugar for refineries, and raw iron. Also in a lesser degree, meat, wine in casks and bottles, iron rails, cotton yarn, and various other articles. With regard to the falling off in raw sugar, it is to be remarked that in consequence of the unfavourable harvest the prices of Indian raw sugar rose, and that the factories of beet-root sugar appear to have received a new impulse.

There was an increase of importance in dues from unwrought tobacco leaves and coffee.

COMPARISON of the Common Receipts from Dues from Imports and Exports in the first three Quarters of 1864 and 1863 in the Zollverein.

* Eastern Union.

† Western Union.

The receipts from import and export dues when compared to those of 1863 for the whole year, show a falling off in 1864 to the amount of 1,204,436 thalers: the decrease in receipts was from import dues, 1,201,353 thalers; from export dues, 3,083 thalers; total, 1,204,436 thalers; which is 5 per cent. less than 1863.

1.—*Import Dues.*

Deductions made for back payments, indemnifications, &c.; the gross receipts were in 1863, 25,574,880 thalers; in 1864, 24,369,114 thalers; decrease in 1864, 1,205,766 thalers.

This is attributed to the war with Denmark, and the consequent blockade of the North Sea and Baltic ports, the continued war in America, the disturbances in Poland, and partly to the alarm with regard to European affairs in general, which had a depressing effect upon trade in general, as well as to the uncertainty with regard to the crisis in which the Zollverein was still at the end of the third quarter. Then again the navigation, which had been impeded during the whole winter, was only free again in the course of March, whereas in 1863 it continued open the whole first quarter. Many merchants too, under the belief that the Treaty with France would come into operation on the 1st of January, 1865, and would cause considerable reduction of dues, reduced their supplies of many wares; and, added to this, a large amount of articles of consumption which find in general a ready sale in Prussia, from Mecklenburg were sent to the seat of war in Schleswig. With regard to the receipts from import dues in the single States of the Zollverein, it will be seen from the Table given below that the falling off, to the amount of more than 10 per cent as regards 1863, was greatest in Hanover and Oldenburg; this minus did not reach this per-centage in Prussia and the Grand Duchy of Hesse; in Brunswick and Bavaria it was less considerable. The amount of increase of receipt did not reach in either of the States 10 per cent., whilst in Thuringia it was 6, in Frankfort-on-the-Main 6, in Saxony, in the Grand Duchy of Hesse, in Nassau 4, and in Baden 3 per cent. In Wurtemberg the receipts remained with little difference the same as last year. Contrary to what usually

takes place, the demand for raw sugar for refineries of the Verein was of considerable importance in the fall of the receipts; the amount of raw sugar imported in 1864 was not three-fifths the amount of that imported in 1863; a result which can be attributed to the bad harvest, and the consequent high prices to purchasers.

Next to sugar, the minus of most importance was in raw iron; in consequence of the high prices of iron in England there was a very large consumption of Zollverein iron. The diminished import of wine in casks, as well as in bottles, was caused by the expectation of a reduction in the Tariff, and there was only enough imported to meet the actual demand; there was a much less demand for iron rails for railways, which caused the falling off in iron and steel, the import having been more than usually large in 1863; there was a diminution in the duties paid upon American bacon and lard; and there was but a very limited business done in woollen goods of all sorts, and silk goods. The articles on which there was decrease of duties paid of minor importance were hops, cheese of all sorts, tea, coal, and a few other articles.

There was an increase of duties paid upon raw coffee, and in a less degree upon other raw products, raw and quite raw iron goods, and unwrought tobacco leaves. The increase in tobacco leaves is owing to the increased demand for the cigar factories. The increase in the import of other raw produce, of petroleum, of quite raw and raw iron goods, is attributed to the erection of new, and the extension of old factories, and to the increase in the use of cast iron tubes for water works. The increase in the import of dried southern fruits and spices is owing to the good harvest of those articles, and the consequent low prices; the increase in the import of lean swine was owing to the prohibition of import from Poland.

2.—*Export Dues.*

There was a decrease of export dues in the Eastern Union (as compared to 1863) of 2,322 thalers; and in the Western Union of 761, making a total of 3,083.

The decrease in the Eastern Union is attributed to the decreased export of raw hides and skins for the preparation of leather, raw hair, &c.

(No. 2 A.)—*Receipts of the Zollverein in the first Quarter of 1865, as compared to 1864, from Import and Export Dues.*

The receipts of the Zollverein from import and export dues in the first quarter of 1865 amount to 4,726,023 thalers; in the same period of 1864 they amounted to 4,896,263 thalers; so that there was a diminution in the receipts of 170,240 thalers. Although commerce and trade generally suffered from the unfavourable nature of the circumstances of the Zollverein, the diminution in the import and the import dues is to be attributed chiefly to the duration of the winter, which kept the navigation closed till the end of March. By the side of the uncertainty of political circumstances, and particularly the continuance of the war in America, the high prices of colonial wares impeded purchases for speculation. It has thus come about that though the new Tariff comes into operation on the 1st of July, and with it considerable reductions, many goods have been put into an expectant position, the consequence of which will be that there will also be a falling off in the second quarter of the year.

Of the articles on which there has been a falling off in duty paid, the principal one was raw coffee; the amount imported only meets the demand. There was a slight falling off in the importation of dried Southern fruits, silk wares, woollen goods, wine in cask, brandy of all sorts, meat, herrings, and some other articles. There was an increase in import dues from very coarse and coarse iron wares, raw iron, unwrought tobacco stalks, lean swine, raw sugar for refineries, and wine in bottles.

(No. 11.)—*Schleswig-Holstein Dues Receipts in 1864-65.*

TABLE of Customs entries of the Duchies of Schleswig-Holstein for the period from 1st April, 1864, to 28th February, 1865, compared to the same period in 1863-64.

	Schleswig.		Holstein.		Total.
	1863-64.	1864-65.	1863-64.	1864-65.	
Entrance dues and stamp dues on playing cards and on the purchase of vessels	Marks. 1,638,522	Marks. 1,720,788	Marks. 3,412,786	Marks. 3,288,042	Marks. 4,988,780
Export dues	53,572	52,239	106,318	86,239	138,478
Transit dues and rent of Custom-house	1,556	1,547	64,931	58,648	60,195
Least money and fire money	108,914	73,317	79,834	52,424	136,741
Taxes of all sorts	127,347	123,313	239,783	222,109	344,432
Brunstener (tax on spirits distilled)	323,261	382,297	319,858	351,172	783,469
Tax paid by foreign commercial travellers, enabling them to trade, and various receipts	12,317	15,335	69,804	56,441	71,776
Total	2,265,999	2,368,786	4,298,264	4,094,075	6,162,861
From which have to be subtracted of bonifications on export and other back payments :—					
Entrance dues	19,266	25,512	393,316	248,643	274,155
Tax on spirits distilled	12,295	9,492	16,299	11,589	21,061
Total	31,561	35,004	407,615	260,232	295,216
Total of entries after deduction of money paid back	2,234,438	2,333,782	3,890,649	3,833,843	6,120,147
					6,167,625

The gross entries of the two Duchies amounted in the eleven months of the year 1864-65 to 96,402 marks less than during the same period of the previous year. But as the export bonifications of the financial year 1864-65 during the same period amounted to 143,880 marks less, there is, in fact, for the present financial year a receipt from Custom dues a plus of 47,478 marks. In comparing the entries raised for the above period there was for the Duchy of Schleswig an increase to the amount of 99,284 marks; and for the Duchy of Holstein a decrease to the amount of 51,806 marks; for the two Duchies together the above-named plus, 47,478 marks.

For the first ten months of the financial year 1864-65, after deducting the dues paid back, as compared to the same period of last year, a plus of 52,903 marks; and the result of the month of February of this year as compared to that of last year gives a minus to the amount of 5,425 marks.

(No. 16.)—*Statistics of the Budget of Prussia.*

According to the Report of the Committee on the Budget in the Second Prussian Chamber, the gross receipts of the State have increased from 91,338,448 thalers in 1849 to 150,714,031 thalers; the expenditure has increased from 95,899,606 thalers to 150,714,030 thalers. The estimated receipts and expenditure of the proposed Budget for 1865 amounted to 59,539,651 thalers, 59 per cent. higher than in 1849, while the population has not increased 17 per cent. since 1849. It must be borne in mind that the considerable increase in the receipts was caused by a rise in the receipts from the property or wealth of the State (railways, forests, and property in mines), and a considerable share of the increase in the expenditure was caused by the consequent increase of expenses of administration.

There were in the general State Chest ("Kasse") at the end of 1864 disposable means to the amount of 26,000,000 thalers; the actual hard money in the State Treasury at the end of 1863 amounted to 21,000,000 thalers. There were taken from the Treasury in 1864 10,000,000 thalers (5,000,000 of which were employed in defraying the expenses caused by the levying of the land tax, and 5,000,000 were employed to cover partially the expenses of the war with Denmark); there remained in the Treasury a balance of 11,000,000 thalers in 1864.

The disposable funds of the general State chest consisted of—

1. The sums taken out of the Treasury.
2. Surplus from the administration of the State in 1863.
3. Residue of the expenses of the current administration.
4. Savings of the administration of the residue of 1862, and *retro*.

The receipts from the administration of the domains have remained much the same since 1849; those of the administration of the forests have increased from 4,672,034 thalers to 9,443,078 thalers. The total receipts of the fiscal mine, foundry, and saline administration have continually increased, with the exception of 1859. They amounted in 1849 to 4,551,000 thalers, in 1855 to 8,929,000 thalers, in 1863 to 12,185,000 thalers. The receipts from the salines increased for the same period from 1,230,000 thalers to 1,349,900 thalers, or 10 per cent. The receipts from the foundries rose from 1,531,000 thalers to 3,088,000 thalers, or 102 per cent., and those of the mines from 1,790,000 thalers to 7,748,000 thalers, or 333 per cent., a result in a great measure owing to the increased produce of coal, giving great hopes for the future. The dues upon mining works (which were reduced in 1850 from 10 to 5 per cent., on the 1st June, 1862, to 4 per cent., and on the 1st June, 1863, to 3 per cent., exclusive of 1 per cent. survey tax) produced in 1849 690,593 thalers, in 1850 850,172 thalers, in 1855 999,349 thalers, in 1858 1,278,471 thalers, in 1861 1,023,616 thalers, in 1862 964,824 thalers, in 1863 809,804 thalers.

With regard to the administration of the Post Office it is shown how, in consequence of the reform of the postage, the receipts increased from 6,834,000 thalers, in 1849, to 12,256,000 thalers in 1863; the surplus of 591,000 thalers, in 1849, amounted to 1,806,000 thalers in 1863. The administration of the railways in Prussia is a source of rapidly increasing receipts.

The total gross receipts of the direct taxes amounted, in 1849, to 20,347,131 thalers; in 1863, to 27,802,245 thalers; and for 1865 it is reckoned at 31,511,632 thalers. The increase therefore in 1863, as compared to 1849, was 36 per cent.; in 1865, as compared to 1849, it is 54 per cent.

The population of Prussia increased from 1849 to 1861 only 12·8 per cent. Leaving out of consideration the fixed portion of the taxes, the land-tax, which was of the nature of a rent, and looking only at the variable portion, it is found that there is a much greater proportion of increase of amount, the increase being, since 1849, $75\frac{1}{2}$ per cent., or five times as much as the increase of the population.

The increase of the gross receipts from indirect taxes, in the period from 1849 to 1865, can be estimated at 10,440,000 thalers, or 36 per cent. The changes which have been introduced into the system of taxation consist partly in changes of the Tariff duties, where several articles have been reduced, and partly in the tax on beet-roots, which was raised from $1\frac{1}{2}$ silver groschen to $7\frac{1}{2}$ silver groschen, in order that the Government might keep up the receipts from the use of sugar, and partly in the reduction of river dues; there were changes also made by raising the tax on brandy one-half (1854–55) and by the introduction of the stamp upon newspapers, which has brought in during the last three years on an average about 420,000 thalers. These last-named increases amounted altogether to 2,820,000 thalers. The law on fees ("Sportel") of 1851 caused an increase of about 2,000,000 thalers to be carried to the account of the Ministry of Justice from receipts from stamps. In the Report of the Committee it is stated that from the beginning of 1850 to 1863 the tax upon salt, owing to the monopoly of salt, has risen 19 silver-groschen 6 pfennings per ton, which produces an increase of tax to the amount of 487,000 thalers, and the Committee proposed that in consequence of the salt being produced at a cheaper rate it should be reduced to 135,000 thalers.

The material expenditure of the Ministry of Commerce (exclusive of the cost of administration), amounted to 7,977,100 thalers in 1849, and it is reckoned in the proposed Budget of 1865 at 7,012,800 thalers, or 964,300 thalers less than it was sixteen years ago. The actual expenditure for 1849, and the means required for 1865, are in the following proportion as regards the separate items: maintenance of water-works and unmacadamized roads in 1849, 1,233,890 thalers; in 1865, 1,448,310 thalers; maintenance of

high roads, in 1849, 2,019,734 thalers; in 1865, 2,493,450 thalers; for new roads, in 1849, 3,623,000 thalers; in 1865, 1,200,000 thalers; for land, water, and public works, in 1849, 521,210 thalers; in 1865, 1,715,600; for maintenance of the district roads on the left bank of the Rhine, in 1849, 214,466 thalers; in 1865, *nil*:—total, in 1849, 7,612,320 thalers; in 1865, 6,857,360; showing a decrease, in 1865, of 754,960 thalers. Since 1853 there have been constructed $119\frac{1}{2}$ miles of road belonging to the State; in 1853, $27\frac{1}{2}$ miles; in 1854, $12\frac{1}{2}$ miles, and the same amount in 1858, 1859, and 1861; in 1864, 1 mile. There was appended a sum of 145,543 thalers in 1850 on industrial school affairs, and 136,200 in 1865. The contribution from the receipts and expenditure of the administration of justice has diminished from 2,099,028 thalers in 1854 to 576,818 thalers in 1863.

The expenditure of the Ministry for Ecclesiastical Affairs has risen in 1849 to 1863 from 3,574,168 thalers to 4,571,196 thalers, that is, 28 per cent., while the population increased 16 per cent., and the expenditure of the administration of the State increased 56 per cent. The expenditure of the Ministry of Public Instruction was reduced during the years of the organization of the army (1860–62) 160,000 thalers.

The ordinary expenditure of the State for elementary schools amounted, in 1849, to 231,729 thalers; in 1863 to 259,156 thalers, 12 per cent. higher, and in the Budget of 1865 it is put at 239,494 thalers, which is nearly the amount of 1849. The total expense for elementary schools in Prussia, according to the statistical reports of the Ministry for Public Instruction, is reckoned at, for 1863, 9,902,696, of which sum 2,320,968 is raised by school money, 7,142,800 is given by congregations and foundations, and the State gives the small amount of 438,928 thalers. Amongst the substitutes ("Ersatzmannschaften") in the years 1863 and 1864, notwithstanding the obligatory school education, there were in the province of Prussia 20 per cent., in the whole Kingdom 5 per cent., without a school education. The income of the elementary school teachers in many places does not equal that of the mason, the factory worker, or even the day labourer.

The expenses of the Ministry of War for 1865 were estimated for 1865 in ordinarium at 32,498,516

thalers, in extraordinarium at 1,835,000 thalers, making a total of 41,333,516 thalers. The estimate is made upon the supposition that there will be, with few exceptions, during the whole year 1865, a standing army of 211,701 men under arms. There is a further requirement in 1865 (as compared to 1852) of 11,250,177 thalers and 73,701 men, and of 8,583,520 thalers and 60,701 men (as compared to 1858). As compared to 1852 there is a requirement of 37 per cent. outlay and 53 per cent. more men, while the population has only increased 13 per cent. In comparison to 1858 there is a requirement of 26 per cent. more outlay, 40 per cent. more men, while the population only increased $7\frac{1}{2}$ per cent.

The Committee recommended that there should be a thorough and complete change and reduction of the estimates for the Ministry of War.

(No. 17.)—*Report on the Administration of the Prussian Bank for 1864.*

The year 1864 began under serious difficulties, and kept its earnest and threatening character without interruption up to its close. The country entered it preparing for war against Denmark. February brought the war; the blockade of the Baltic ports soon followed, to which was added the fear of further political embarrassments; and when at last peace put an end to these anxieties, the want of money, having forced the discount up to 8 and 9 per cent. at other large banking-places, assumed in Prussia a threatening aspect; so that the Bank, in order to prevent the drain of silver, had to raise the discount likewise to 7 per cent.

The pressure was, under these circumstances, particularly heavy upon the shipowners, the agriculture and commerce of the Baltic provinces, whence the export was put an end to altogether during the greatest part of the period of navigation by the blockade, and they felt doubly the pressure of the shortness of money. But other provinces also suffered under it more or less; and only a few branches of industry, as the mining industry, the manufactories for the further preparation of the mining produce,

the cloth and linen manufactories, enjoyed a profitable activity.

The last year was decidedly favourable to the business of the Prussian Bank, on account of the uninterrupted large investment of capital and the high rate of interest, and the profit was the largest that the Bank has ever realized.

All the business transactions of the Bank executed in 1864 amount together, irrespective of the prolongation of advances upon goods and securities, to 1,979,000,000 thalers, and if are added to this the sums belonging to the provincial branch offices of the Bank and other sources, to 3,215,000,000 thalers; that is to say, 89,000,000 and 120,000,000 thalers more than in 1863.

The sum of all bills of exchange on inland places or foreign places bought or taken for being cashed, amounted to—

	Bills.	Value.		
		Rth.	sg.	pf.
In Bills of Exchange discounted, payable in Prussia at the same place wherethey were bought	288,242	218,951,629	2	6
In Bills of Exchange payable in Prussia at places different from those where they were bought	611,818	305,624,764	0	0
In Bills of Exchange upon foreign places	10,049	13,356,150	26	6
In Bills of Exchange to be cashed by the Bank	26,365	2,251,501	8	6
Altogether	945,974	540,184,045	7	6

Therefore 52,567 bills, amounting to about 18,321,000 thalers more than in 1863.

Of advances upon goods and securities in 1864, there were granted 4,557, amounting to 72,493,600 rix-thalers (in 1863, 68,553,500 thalers), of which, at the close of the year, 12,794,000 rix-thalers remained standing out.

The capital engaged in bills of exchange and in advance upon goods and securities transactions amounted to 79,086,000 rix-thalers, and was by 6,802,000 rix-thalers higher than in 1863, though the average of the capital thus employed in 1863 had been higher already by nearly 16,000,000 rix-thalers than

that of 1862, and nearly 20,000,000 rix-thalers higher than that of 1861.

Cheques from one office on another of all sorts were issued to the number of 12,653, amounting to 34,371,000 rix-thalers.

The temporary deposits made with the Bank, and the Bank acceptances put into circulation against them, amounted on an average together to 1,766,000 rix-thalers, and were therefore 406,000 rix-thalers lower than in the preceding year.

On the 30th December, 1864, the Bank had invested in Government securities and railway shares bearing interest, 14,947,130, that is, 4,669,000 thalers less than at the end of 1863.

The circulation of bank-notes has amounted to an average of 116,000,000 thalers; there have therefore been in circulation about 3,296,000 thalers more than in the preceding year.

The average sum of metal store in the cash-fund of the Bank amounted to 65,470,000 thalers, *i. e.*, 56½ per cent. of the average amount of the bank-notes in circulation. Of silver there were bought in 1864 in bullion and foreign coins for 6,873,000 rix-thalers, and sold for 531,000 rix-thalers, so that there remained a sum of about 10,653,000 rix-thalers in hand—6,260,000 thalers more than in 1863. In consequence of these silver purchases the business with the correspondents of the Bank has been pretty considerable, and bills of exchange have been remitted to them amounting to about 6,626,000 thalers, leaving a balance in favour of the Bank of 1,388,000 thalers.

The whole gross profit of 1864 amounted to 4,996,681 thalers 5 silbergroschen 6 pfennings, of which, after the deduction of the expenses of administration, the interest that had become due on deposits, the expense of making the bank-notes, the loss on silver, &c., amounting altogether to 1,272,801 thalers 26 silbergroschen, a profit is left of 3,723,879 thalers 9 silbergroschen 6 pfennings. Out of this have been paid, first, 4½ per cent. upon shares in private hands, and 3½ per cent. on shares belonging to the State, worth 741,423 thalers, as well as, according to § 5 of the Agreement of the 28th January, 1856, and § 3 of the Law of the 7th May, 1856, the interest and amortisa-

tion of the loan granted to the Bank. From the remaining sum of 2,360,546 thalers 9 silvergroschen 6 pfennings are still to be deducted the 36,947 thalers 15 silvergroschen 6 pfennings, excessive of that of the preceding year, after calculating the profit for doubtful claims and not yet settled expenses of building; so that a net profit of 2,323,598 thalers 24 silvergroschen remains, of which, according to § 6 of the Law of May 7, 1856, is to be added to the account of the Reserve Fund, one-sixth being 387,266 thalers 14 silvergroschen, and the remainder, amounting to 1,936,332 thalers 10 silvergroschen, is to be divided, one-half to the State, the other as extra dividend to the shareholders. The latter receive, therefore, for 1864, an interest of $10\frac{1}{2}\%$ per cent. (for 1864, $7\frac{3}{4}\%$ per cent.), or for each share 109 thalers 15 silvergroschen; so that after the deduction of the 45 thalers already paid for the first and second half-year, 64 thalers 15 silvergroschen remain to be paid.

The State received from this Bank—

	Thalers	sg.	pf.
(1.) For interest on the capital advanced 1,897,800 thalers at $3\frac{1}{2}\%$ per cent. ..	66,423	0	0
(2.) For payment of interest and amortization of Government loan of 1856.. ..	621,910	0	0
(3.) Half of the net profit	968,168	5	0
Altogether	1,656,499	5	0

Balance of the Prussian Bank, December 31, 1864.

* With Guarantee.

One German mile less than five English miles.

One dollar (rix-thaler) equal to 3s.

Remarks.

	Miles.
According to the foregoing Table there were in use at the end of 1863	851·873
To these must be added some lines of foreign railways lying in Prussian territory, namely :—	
1. Brunswick Railway	2·424
2. Saxon Silesian Railway	2·490
3. Hanoverian West Line—	
<i>a.</i> Löhne-Osnabrück Line	2·329
<i>b.</i> Osnabrück Rhenish	4·910
<i>c.</i> Lingen Rhenish	0·680
	<hr/> 7·919
	<hr/> 12·833
Making a Total of	864·706

But after deducting from the above calculation those portions of lines which are not in Prussia, but which belong to Prussian Railway Companies, namely :—

	Miles.
Of the Berlin-Hamburgh Railway	19·014
Of the Magdeburg-Leipsic Railway	4·581
Of the Berlin-Anhalt Railway—	
<i>a.</i> Trunk line	6·494
<i>b.</i> Branch line, Jüterbock-Russa	1·519
<i>c.</i> Dessau-Bitterfeld	2·532
<i>d.</i> Bitterfeld-Leipsic	1·232
<i>e.</i> Junction line Leipsic	0·081
	<hr/> 11·858
Of the Thuringian line	19·962
Of the Aix-la-Chapelle-Mastricht line	7·549
Of the branch Hasselt-Lunden	3·721
Of the Rhine-Nahe line	4·885
Of the Deutz-Giessen line	3·701
	<hr/> 75·271

The actual extent of Railway in Prussia at the end of 1863 was 789·435

Ad I, 1. Ostbahn (Eastern Railway).—Ad Column 3. Exclusive of the junction line between the frontier stations of Eydtkunen and Wirballen of 0·16 mile, and that part between the frontier station of Otloczyn and the Russian Polish station Alexandrowo of 0·57 mile.

Ad Column 7. Inclusive of 5,080,948 thalers building expenses of the great bridges over the Vistula at Dirschau, and over the Noyat at Marienburg.

Ad Column 17. Inclusive of 638,209 centners rolling stock, and 53,456 centners property for building, for which 33,144 thalers and 18,817 thalers respectively,

or 0·97 pfenning and 5·88 pfenning per centner and mile, have to be taken into account, but exclusive of 921,856 centners rolling stock, and 7,369,253 centners earth and gravel for building or construction forwarded free of expense.

Ad Column 38. The expenses of administration named under this head should be charged to the fund of reserve of completion, and of renewal if it existed on this line.

Ad I, 2. Niederschlesische - Märkische (Lower Silesian and Mark Line).—Ad Column 7. Since 1852 there has been taken out of the receipts a sum of 3,999,457 thalers, which has been spent on the ground property of the line and on the means for working it, so that the expense of construction, including all assignments, can be reckoned at 32,681,246 thalers, or 633,063 thalers per mile.

Ad Column 9. The service of the Berlin station junction line is performed by eight engines. The numbers of miles traversed by this line have been specially named, and must also be taken into consideration in Columns 46 and 47.

Ad Column 17. There was a further dispatch gratis of 1,109,801 centners of rolling stock with 24,369,820 centners miles, and 4,950,071 centners building material with 9,788,811 miles.

Ad I, 3. Station Junction Line of Berlin.—This is under the direction of the Lower Silesian-Märkisch Railway, which supplies also the means of transport and the steam-power. Only goods are sent on this line, and exceptionally extra trains, and engines and carriages, from the establishments where they are constructed. Goods pay according to the number and size of the carriages or trucks used for their transport. Zinc pays according to weight. There were transported altogether, besides 178,541 centners of zinc, 1,009,613 centners of coal and coke, and 238,518 centners of salt, and 206,334 carriages or achsen.

Ad I, 4. Westphalian.—Ad Column 4. The extent of the Westphalian line is 27·710 miles, of which 0·610 mile, namely, the portion Warburg-Landesgrenze is let to the Kurfürst Friedrich Wilhelm Nord Bahn, at 50 per cent. on the gross receipts.

Ad Column 38. Of the expenses given there are

69,129·2 thalers for renewing rails and sides; 56,583·4 thalers for renewing engines; and 57,793·6 thalers for renewing carriages.

Ad Column 53. A sum of 341,502·8 thalers was paid to the General State Kasse as a surplus, from which, after a deduction of the sum of 1,486 thalers for the amortization of the preference shares of the Münster-Hamm Railway, a rent of 2·55 per cent. is yielded on the capital of construction.

Ad I, 5. Saarbrück—

	Miles.
The extent of the Saarbrück and Saarbrück and Treves line is	18·614
To which is added the rented French portion from the Prussian frontier to Forbach	0·640
	<hr/>
There are in use	19·254

Ad II, A, 1. Wilhelmsbahn.—The administration of this line since 23rd April, 1857, has belonged to the State.

	Miles.
The length of the trunk and branch line is ..	21·380
There is a portion also rented (that portion called the "Landesgrenze Oderberg" and the "Kattowitz Idahutte Emanuel segen")	2·080
	<hr/>
Making a total extent of line in use of	23·460

Ad II, A, 2. Upper Silesian—

	Miles.
The length of the trunk line with the branch lines, and that portion opened March 12, 1863, "Neuberun Oswiezim," is	35·350
Of which a portion is let to the amount of	1·865
	<hr/>
Total length of line	33·485

Ad II, A, 4. Bergisch-Märkisch—

	Miles.
In 1862 the extent of railway in use of the Bergisch Märkisch line, with the portion Dusseldorf-Dortmund and Dortmund-Soest, and Witten-Duisburg and Ruhr-Sieg Railway was	42·410
1. From the acquisition of the Prince Wilhelm Railway and its use in 1863	4·270
2. From opening—	
a. The junction line between the Prinz Wilhelm Railway and the Witten-Duisburger Line, on 1st June, 1863	0·220
b. Coal branch line, Steele-Dahlhausen in 1863	0·520
	<hr/>
Total extent of the line, at end of 1863, in use	47·420

Ad Column 51. Table III, 2, A, shows—

1. On the Bergisch-Märkisch Railway—				Thalers.
The receipts were	2,944,400·3
The outlay was.	1,211,350·0
Surplus				1,733,050·8
The capital laid out on construction was 21,961,122 thalers, equal to 7·89 per cent.				
2. On the Ruhr-Sieg Railway—				Thalers.
The receipts were	806,897·3
The expenses were	349,879·9
Surplus				457·017·4
Which, on the capital expended of 11,844,503 thalers, is equal to 3·86 per cent.				

Ad Column 53. There were paid—

1. On the Bergisch-Märkisch Line—				Thalers.
For interest on 12,967,300 thalers, original shares	843,459·5
„ 9,967,000 „ preference shares	426,931·5
Total	..	22,943,300 thalers.		1,270,391·0
Equal to 5·54 per cent.				
2. On the Ruhr-Sieg Railway, as interest on 16,344,753 thalers, preference shares—				Thalers.
a. From the Surplus of the line	358,389	= 2·16 per cent.
b. From the Surplus of the Berg-Märkisch Line, as advance	40,861·9	= 0·25 „
Total	399,251·1	= 2·41 per cent.
c. Advance from Government			177,814·6	= 1·09 „
Total	577,065·7	= 3·50 per cent.

Ad II, a, 5. Aix-la-Chapelle-Dusseldorf-Ruhrort ; b, Ruhrort-Crefeld District, Gladbach. Ad Column 17. There were expedited by steamer at Ruhrort, 4,404,756 centners (inclusive of 13,078 centners of Post Office goods); the sum of 70,161 thalers 9 silver groschen 5 pfennings was paid for freight.

The railways mentioned in the foregoing Table extend over 809,403 miles, on which the sum of 422,463,628 thalers (63,369,544*l.*) was expended, and produced a gross receipt of 53,201,932 thalers (7,980,289*l.*); the current expenses of administration amounted to 21,655,392 thalers (3,248,308*l.*), leaving a

surplus of 31,546,540 thalers (4,731,981*l.*); so that the capital of construction gives a receipt (inclusive of what is put on one side for the reserve and renewal fund, and for meeting the taxes) of 7·42 per cent., and in 1862 it was 7·27 per cent.

On reckoning, in addition to this, the sums given from the State fund for the interest and preference shares of the Aix-la-Chapelle-Dusseldorf, Ruhr-Sieg, Stargard-Cöslin-Colberg, and Cologne-Giessen, amounting altogether to 1,263,818 thalers; of the Ruhr-Sieg line given by the Bergisch-Märkisch Company, 40,861·9 thalers; to the Pomeranian line by the Stettin Railway Company, 53,933·0 thalers; to the Magdeburg-Wittenberge line, by the Magdeburg-Halberstadt Company, 22,551·7 thalers; to the Cologne-Giessen line, by the Cologne-Minden Company, 127,453·2 thalers; to the Oberhausen-Arnheim line, by the Cologne-Minden Railway Company, 33,857·3 thalers; in all, 1,542,475·4 thalers; there is a result for 1863 for the railways under the administration of the State, of an average rent of 4·56 per cent.; for those under private administration of 6·05 per cent.; and for all lines of 5·63 per cent.; whereas it was in 1862, 4·48 per cent., 5·58 per cent., and 5·40 per cent.

At the end of 1863, according to the foregoing Tables, there were given over to traffic, 851·873 miles; at the end of 1862, 811·653 miles; giving an increase of extent 40·220 miles, of which the principal increase took place on the Rhenish line, by the opening of the Crefeld-Cleves portion (8·590 miles), and the opening of the Vor-Pommersche Pomeranian portion (40·350 miles).

(No. 19.)—ACCOUNT of the Sea-going Vessels which Arrived at, and Left, Prussian Harbours, in 1864, including Steamers.

INTELLIGENCE relative to Vessels which arrived in 1864.

The small numbers show the number of steamers included in the larger numbers.

(No. 21.)—*Table respecting the Jews in Prussia.*

A Map has lately been published by the Society for the Conversion of Jews, showing the amount and distribution of the Jewish population in Prussia. Accompanying the map is a Table, of which the following is a translated copy:—

Place.	Square Miles.	Number of Jews.	Jews to Square Miles.	Number of Christians.	Per-centage of Jews and Christians.
Prussia..	1,178·03	37,635	31·94	2,866,866	1·31
Posen ..	532·04	74,142	130·95	1,485,550	4·31

(No. 22.)—*Communication with regard to the so-called Pest-Boil Plague (commonly called Jaswa), taken from the Report of the Department Veterinary-Surgeons Winkler and Dressler, made by them to the Government of Königsberg.*

(Translation.)

The alarming intelligence which spread in our eastern provinces, that Russia had been afflicted during the last three years with a malady pernicious for beasts and man, and which was spreading rapidly from east to west, caused the Royal Ministry of Education and Spiritual Affairs, and Medical Affairs, to send the above-named animal doctors to Russia, with the commission to obtain then and there scientific information with regard to the character of this pestilence.

Country and people of the places affected by the pestilence.—The Siberian plague “jaswa şibuska schelwaki,” called by the old Russian doctors black disease, boil plague, now scientifically called pustula maligna, carbunculus, and lienitis, was prevalent in 1864, chiefly in those low countries of Russia intersected by canals and streams in the territories by the side of the Lakes

Onega and Ladoga, of the Rivers Newa, Ocka, Koli-choff, Tschecksna, Malloga, Kjasma, Kuma, Wjalka, and Wolga. The greater part of this deep flat country consists of meadows and pasture land with moor and sandy soil, and is covered with low shrubs and under-wood, and with dwarf scanty pines and firs.

The closest observer will not find any signs of artificial draining, and as the natural fall of the water is not great enough, it becomes so stagnant that these meadows become large swamps of standing water. Only here and there do the larger rivers, where the shore is tolerably elevated, burst through the impediments opposing their course. Almost generally the water of the rivers is of a thick muddy colour, hence follows the want of good drinking water ; pumps of even the simplest construction are seldom found. The water carriage on these waters is chiefly carried on by horses, and as there is a considerable traffic on these waterways a large number of horses are used. Nevertheless, the banks of these waterways are not well adapted to the towing of boats. There is only a choice between a bad pavement and a swamp, so that there is a great demand for horse power.

The cultivated ground of these districts, and cattle necessary for the cultivation, are both very small and limited. Even the larger proprietors are of the opinion that "cattle are of no effective profit, but that they must be kept for the manure." The cultivated parts almost disappear in comparison to the immeasurable plains of meadows, pasture, wood, and moor. Hardly the tenth part of the area is occupied in tillage, although the soil, judging from its physical and chemical construction, more particularly the known black earth, would yield most favourable results. In comparison with Germany, the art of agricultural cultivation is in its infancy. These low portions are only sparsely populated. Villages and lands with few exceptions at great distances from each other, the houses chiefly of two rows in the village and very near each other, are two stories high and entirely of wood ; some look better than others, but they are generally built crooked, looking any way, lop-sided, without any signs of repair, and the wood is in a state of decay. Even in towns, such as Twer on the Volga, in the "Ausspannungen" (small halfway houses with large

courtyards, very roomy, but with low covered sheds), there were masses of mud in the courts, and of dung in the sheds, which could not be walked through. The Russian peasants (mujiks) are at a low point of civilisation. Accompanying good qualities are to be found predominant ignorance, superstition, roughness, disorder, uncleanness. In keeping conscientiously the numerous holy days appointed by the Russian Church, they fall into idleness and poverty. Even the larger landed proprietors give no signs of intelligence in their agricultural arrangements, and thus the good example of the richer, by introducing experiments for the improvement of property, and in encouraging a spirit of enterprize as in Germany, is not to be met with.

Although men and animals live very near each other, the interest in the domestic animal only exists because it is absolutely necessary. When there is not a deep snow the animals have to find their food on the large pasture grounds. They feed, consequently, sometimes abundantly, at other times they hardly find enough to keep them. In the same way they can satisfy their thirst as the opportunity offers. They find the means of doing so in the swampy water of the river, or in the deep holes by the side of the walks, for there are no means provided for watering cattle. In the winter the cattle find in the courts and in narrow dark stalls but little protection against snow and cold, and they get barely the means of subsistence, for the proprietor does not lay up a sufficient quantity of fodder for the winter. The sun has scarcely melted the snow before the cattle are driven on to the pasture-ground, covered with snow-water, from which they crop, exhausted by the privations of the winter, whatever has remained over from the autumn, and the first sprouts of spring (which, with the rapid progress of vegetation, soon appear), without distinction. The temperature increases with the growth of the food, and the animals continue to feed. At the same time there is an increased demand on the labours of the horse. The spring agricultural requirements are very fatiguing, as they are only done by one horse at a time. The mujiks receive wages for the towing of numerous barges along the swampy water-ways, and often against the stream. These clumsy vessels, which are quite flat in front, and more like

long square boxes than vessels, require a proportionately extravagant amount of power, contain grain, stones, bricks, hay, and wood. This heavy towing work, which lasts the whole day without any intermission, generally lasts for many days at a time; and during the short dewy nights the horse has to seek its own food. The work is often so heavy that the animals can only move at a snail's pace, and that with perpetual driving; and even beasts without burdens, in autumn at least, have great difficulty in overcoming the difficulties of the ground. On the 29th of September and the time when this report was being made, 2,000 horses were occupied alone in towing barques on the canal from New Ladoga to Schlüsselburg. On the Volga at Twer, where there is a good deal of business in the transport of goods by water, the reporters saw ten horses in a row, following each other, drawing barques laden with hay and grain, whilst they were driven by three men. There is still harder work done during months by the horses which are carried in the barques themselves; there are sometimes fifty horses together; more than twelve at a time may be seen towing at once.

The cattle find less consideration than the horses; they are kept in smaller quantities, as they are not of so much use. Sheep and pigs, affording clothing and food to the population, live in perfect freedom with the mujiks, and are exposed to all the pernicious effects of the bad climate.

Nature of the Pestilence in Former and Present Times.—

In former times, at the beginning of the eighteenth century, according to the Church records, the jaswa gave rise to processions and prayers, and to exhibitions of the miracle-working picture of Nicholas in Tobolsk. At a later period learned travellers made scientific reports upon the pestilence. It is mentioned by Gmelin, Pallas, 1768, and Renowatz. Since 1740, at which time Gmelin found it to be a much dreaded malady on the Irtisch, it broke out every year in the hot time of the year in Western Siberia, killing men and horses. Sometimes more, sometimes less prevalent, it extended itself by degrees from its place of origin, following the course of the Rivers Tobol and Irtisch, passing along valleys and over plains, over sandy and moory soil, killing all domestic animals,

and many people and horses. Its break-out always follows the beginning of hot weather, and ceases after cold weather or cooling rain; such was also the case formerly with the plague. In 1798 the *jaswa* spread itself in an unprecedented manner from the Government of Tobolsk south-west to the Caspian Sea and the Ukraine, west to Lithuania, north-west to the Baltic, and north to the White Sea. In the beginning of the present century the pestilence took an eastern direction up to the Chinese frontier; in 1823 it was in the Governments of Kasan, Tamien, and Cherson, where it was unknown up to that period; it was also prevalent in the Lower Volga at Charkow and Rjäsan, and not till within the last three years did it take a westerly course to an imaginary line drawn from the White Sea through St. Petersburg to Witepsk, and hence to Astrakan, killing chiefly horses, then oxen, sheep, and pigs, and human beings; in some places it only killed domestic animals, in others only horses and oxen.

According to the official Lists, upon which implicit confidence cannot be placed, there were lost in 1864, 72,309 horses; the loss is, however, reckoned, of horses 100,000, of oxen 60,000. There died in the Government of—

					Horses.
Novgorod	26,000
Jaroslav	12,000
Olonec	4,860
Petersburgh	4,109
Twer	4,000
Wologdoff	2,182
Total					53,151

The number of the different domestic animals killed and cured in the six districts of the Government of Novgorod is as follows:—13,888 horses, 4,300 oxen, 2,308 pigs and sheep, whilst the cured are given as 1,059 horses, 578 cows, 95 pigs and sheep. In the district New Ladoga 2,132 horses, 568 cows, and 565 sheep (pigs not known). At some of the places of the last district nearly all the horses died which were employed in towing vessels; at other places of the same district there were only single cases of deaths, and at others some were not even attacked.

Of persons attacked by the *jaswa* there were 938,

of whom 302 died, and in the six above named districts of the Government of Novgorod there died 197 men and 30 women; there were cured 285 men and 75 women.

In 1864 the weather was such as to develop and increase the *jaswa*. The spring came late after the snowy winter. The snow melted consequently very quickly all at once; the water covered the low parts, and a luxuriant vegetation was developed. The air was sultry and heavy, loaded with miasmas, and early in June the temperature on the Upper Volga in the shade on a calm day rose to 30° R; the nights were cool, and in consequence of the pressure of water in the atmosphere, they were damp. The pestilence consequently increased in its circumference. It broke out on the 12th of June in the Government of Wologda, on the 17th in the Government of Petersburg, on the 22nd in the Government of Wladimir, on the 25th in that of Olonec, on the 26th in that of Twer, on the 27th in that of Kostrema, on the 9th of July in that of Jaroslaw and Orlow, where it ceased in a week, on the 26th July in that of Wilen, on the 27th July in that of Moscow. In proportion to the temperature it was at its worst from the 20th to the 28th June, at which period the heat was the greatest. When the temperature became cooler the pestilence decreased, and in some places ceased entirely. From the 14th of July, when the heat again increased, the pestilence increased with it; from the 20th July, when a good deal of rain cooled the air, there were no new cases of the disease. In September there was an end to the malady, when the Veterinary Surgeons and the Reporters, who received assistance from the Russian authorities, visited the places in which the pestilence had been.

Nature and form of the malady Jaswa.—The *jaswa* appears in general in two principal forms, which occur separated by the side of each other, or passing over from one to the other. It is either (a) a rapid apoplectic or (b) a slowly progressive malady, of an exanthematic nature (boil pestilence), which is called by many a diphtheric form.

(a.) The apoplectic form was always of short duration, seldom lasting many hours, under the following symptoms: sudden stupefaction, staggering, trembling, difficulty in breathing, sometimes with

involuntary noises, falling down with sudden death or with slight trembling. In general there was no appearance of boils, but in cases where the course of the malady was not so rapid boils were seen to develop themselves at an early stage. The apoplectic form was of rarer occurrence, and was always accompanied by death.

(b.) The exanthematic form or boil pestilence was of more frequent occurrence, and was not always fatal. It begins with a sudden painful trembling, and after a few minutes up to within an hour a careful observer will perceive a small swelling, generally in the part connecting the head with the neck, oftener on the breast, on the windpipe, on the dug, on the lower part of the belly, less often on the ribs, on the hinder part of the thigh, and near the back. These pustules increase rapidly in size, penetrating deep into the cellular tissue. They are neither particularly hot nor irritable, sometimes elastic and yielding, sometimes very much swollen, hard to the touch and immoveable. On dissection, decomposed ingredients of the blood were found. As the boils increase the trembling ceases, and a feverish general suffering comes over the whole body. Animals become inattentive to what is passing, motionless and tremulous. Notwithstanding the high fever the appetite does not cease entirely, and the other normal functions of organization continue without being much disturbed. Horses often fall down with the food in their mouths. Recovery is less frequent in this form of the malady than death. The malady shows itself in the gradual dispersion of the boil, or by the breaking off of that part of the skin attacked by the boil and injured by the surgical applications and bandages; death ensues at latest in fourteen days, generally suddenly. The boil development ensues in many cases after the feverish state has already appeared. This transition state was always followed by death in few days.

The bodies, if not always in the same degree, soon corrupt and emit a horrible odour. The bodies on being opened often present a frothy bloody effluxion. The dead animals, in consequence of the deficient police regulations, remained lying there where they died at the beginning of the pestilence. When they

died in the boats they were thrown often into the water, were floated up to stagnant places, where, thoroughly decayed, they infected the whole atmosphere. In 1864 the pestilence is said to have first come to Petersburg, as carcasses which had floated down from the Ladoga canal were landed in numbers on an island of the Newa at St. Petersburg. The examination of the corpses in the rapid cases of death from the malady showed an abnormous collection of blood, and an overflow of dark red, partially liquid, substance in the texture of the nerves and in the neighbourhood of the great organ of the lungs, the liver and the spleen; the latter, generally very dark, seemed soft and bloated.

In cases of exanthematic jaswa the boils or pustules were often of a very large size. At the bottom of the pustules there was always some yellowish sedematous matter, which penetrating the body from the outer surface penetrated its texture, and even got as far as the great internal cavities and the organs situated in them. The fat had always entirely disappeared, having become that yellowish matter; the blood looked as brown as tar. The organs of the abdomen were full of dark coloured blood, and soft in the cells; the blood was darker than in a normal state; the spleen and liver were in the same condition as in the cases of apoplectic jaswa. When the boils were in the pectoral cavity the heart and lungs were similarly affected.

With oxen the same appearance was presented in the corpses as with horses. Sheep were attacked by the apoplectic form. Nothing reliable is known with regard to pigs attacked by it.

As regards human beings there are more numerous cases of the jaswa pustule attacking men than women. In this case the symptoms of the malady, occasioned or manifested by the jaswa pustule, are identical with those of the well-known disease pustula maligna. Acute pain first indicates the spot where the pustule is to appear. The pain is soon followed by a redness and swelling near the spot mentioned. A red spot shows itself, which becomes a small itching blister, and this soon increases to a white blue coloured blister, varying from the size of pea to that of a sixpence. This appears on the face and neck, on the

breast, the arms and loins, the hands and feet; no general dangerous illness develops itself, the burning pustule soon breaks off its head, and a cure follows. But if the blisters appear in great quantities on the face or on the rump, a violent feverish (typhoid) discomfort ensues, accompanied by headache, giddiness, and sickness with considerable pain round the swelling, and death follows either after a few hours or in a few days.

There was an opinion in Russia that the jaswa, in some parts, showed itself among human beings before it attacked animals, which is to be explained by the atmospheric and local causes of the malady, and by the peculiar state of the body which was predisposed to the malady; this is particularly the opinion of the country people and the country doctors, from this reason—there are cases recorded where the number of human beings infected exceeded that of the horses, while in other places human beings are said to have caught the infection long before the animals; but generally the contrary was the case.

Causes and contagion of the Jaswa.—As has been seen, the primary causes of the jaswa may be found in a variety of circumstances peculiar to the locality—in the consequent low state of cultivation; in the bad state of the stagnant water; in the consequent prejudicial exhalations, which produce a state of the atmosphere conducive to malaria, in the drinking water being bad, in the rapid succession of the green food and swampy herbs to the scanty winter food, in the conjunction of this unsuitable subsistence with the disproportionate labour of the animals at the beginning of ship and field labour, and in the sudden increase of the heat and the marked changes of weather. In consequence of these circumstances there is a great disposition on the part of the animals to catch cold, the blood is disturbed, and the propensity to take the prevailing malady increases. To this has to be added the great disposition of the horses in Russia to congestion of the skin, which produces a voluntary bursting of the veins as well as an involuntary tearing of the vessels of the skin with the teeth when the animals find themselves in a state of heat. This peculiarity is the consequence of a total neglect of the skin, and to such a degree that it ceases when

the same horses are taken proper care of in a stable. This great disposition of Russian horses to diseases of the skin and bleedings readily explains the very frequent appearance in them of the boil form of the *jaswa*.

At the time the reporters made their journey, the pestilence had disappeared; they could not, therefore, themselves test the opinions given as to its contagion. The majority of the country people, the curers of cattle in the villages, and doctors, are of opinion that the *jaswa* does not contain any contagious matter. Healthy animals lived with unhealthy without injury to the former; and, owing to carelessness, the village practitioners often got wounds in the hands while dissecting, but they did not consequently get the disease. Other country people are quite convinced of the possibility of infection from the *jaswa*, and dread contact with it. They remarked that at some places the disease first appeared after the return of the horses from towing, and that it then attacked other animals. Medical men found that persons had been attacked by it who had come into frequent and habitual contact with sick and dead animals, or who had negligently handled the hides, hair, and hoofs of diseased animals. And generally where the peasants were uneducated and knew little of the malady, there were many cases of illness and death of persons and cattle. When the horses are first taken ill they are employed till the moment of their death, and thus they spread the infection far and near. Near Petersburg the proprietors of horses often sold the skins of the horses that were diseased to the tanners, who became ill from handling them, and in many cases died. On the other hand it is not to be denied that persons got the burning blister who had no connection with diseased animals, that some animals got the disease without spreading it, that the attendants in the hospitals were not infected though they came in close contact with diseased persons.

It has been supposed that some insects, such as wasps, may have been the means of conveying the infection; and it would appear that this supposition is not without grounds of probability, as the poisonous stuff may be conveyed by a bite or sting. Persons who have suffered from the *pustula maligna* appear to believe that they have been stung by an insect on

that part on which the pustula showed itself. The insects held in suspicion may be the tabanus, stomoxys calcitrans, and the rhagiocolum bacensis; the latter appears in great quantities in swampy ground.

Remedies, Sanitary and Police Regulations against the Jaswa.—The cure is undertaken by doctors, and even by the people of the country; when the apoplectic form appears, there is but little time for the arrival of the assistance necessary. It has been recommended to cut at a very early stage the swellings, to burn the wounds with sulphuric acid or potash (kali), to apply compresses of dough and hay seed, tobacco leaves mixed with sal-ammoniac, and a continued application of ice. The peasants made use of compresses of ant-hills, or rubbed the swellings with heated bricks or stones, which produced a scab. The rubbing in, too, of a mixture of creosote and oil of turpentine was found useful. When people were attacked, applications in equal quantities of vinegar-of-lead and of spirits of sal-ammoniac, directly after the local pain began and the swelling appeared, were found to be effective.

As a preventive measure against the spread of the disease, it was in former times recommended that fires should be made, the smoke of which killed the pernicious insect, and warned travellers.

At the last outbreak of the jaswa the Government sent eighty veterinary doctors (no inconsiderable number, considering the scarcity of the educated veterinaries in Russia) to the places where the pestilence had appeared, and they were authorized to attend patients, and even to supply the medicines required, gratis. There was, however, no remarkable decrease in the number of deaths.

At a later period an immediate and deep burial of the carcases was instituted.

The course followed at present with regard to the inspection of animals gives no security against the spread of infectious diseases. The revision is done quickly, in order that the animals may be passed in review rapidly, and that the number of animals may agree with those on the list. Thus the malady is seldom found in its early stage. When the disease is discovered to exist, the animal is not killed, and it remains in the power of the proprietor to kill or not;

if he kills he receives no compensation. The reporters heard a woman state that she had washed what came from the nose and eyes of an infected animal before the veterinary doctors came to visit it.

The conclusion drawn is that the "jaswa sibuska" cannot be represented as a particular pestilence, but that it is a peculiar form of a disease, known in Europe and America under similar circumstances of the spleen disease, or anthrax (lienitis), and in fact of the apoplectic or rapid spleen disease, with boils and swelling of the anthrax, mentioned in a work published in 1845 under the title of "The Pestilence of Domestic Animals, by Dr. Haupt."

(No. 23.)—*Trichinen*.

Experiments have latterly been made at the Veterinary School at Berlin, and formerly at Halle, on the subject of transplanting trichines from one animal to another. Four pigs were used for this experiment. A Report was made upon the experiment, from which it appears certain that animals fed with meat diseased with trichines soon have the disease in their own bodies. The animals were fed daily upon trichine meat; they soon became ill, and three of the animals died within twenty-seven to thirty-seven days. The fourth recovered, but it was proved that on removing some of the flesh the animal was full of trichines. A sort of trichine insurance was consequently established, starting with the idea that the spread of the disease would receive a considerable check if the possessor of a diseased animal were to receive a compensation on the announcement of the animal being affected with trichines. This insurance only depended upon the goodwill of the people, and as there were no funds at hand for the statistical calculations or for the requisite subscriptions another plan was suggested as acceptable, viz., every pig in the country that was killed should be taxed 1 silvergroschen ($1\frac{1}{4}d.$), from the proceeds of which tax the possessors of trichinen-diseased pigs should receive compensation. This would give a security that meat diseased in that way would not be further used for injurious purposes as food for other animals, &c. It remains to be seen what may be the result of this suggestion.

Spain.

Report by Mr. West, Her Majesty's Secretary of Legation.

Madrid, July 1, 1865.

IT is, perhaps, not so much the want of statistical information in Spain as its uncertain nature that renders it more difficult than in most other European countries to arrive at a just estimate, not only of its natural internal resources, but also of the social and commercial progress which it is generally supposed to have made during the last fifty years. The little importance which, comparatively speaking, is attached to its foreign commercial relations with other countries, the state of social and industrial decay into which it had fallen at the end of the last century, and the apparent hopelessness of a better state of things arising, have, combined, had a tendency to isolate it from the rest of Europe. By this want of contact, therefore, with the great movement of commercial progress of the present century, Spain has been left as it were to herself, and her external relations have become necessarily of second importance among the people to local and provincial ones. All stimulus to commercial enterprise comes from abroad, while the people of the country direct their energies rather to maintain a state of isolation, which applies not only to the whole country, but to one province, and to one or any particular interest as regards another. The statistical information, therefore, which is published by the Statistical Department of the Government, and which, perhaps, is more elaborate and detailed than might be expected or desired, must be taken in a point of view as showing not so much the actual progress which the country has made during a certain number of years, as the state of decrepitude and decay from which during that period it has partially recovered. The industrial state of any particular town, district, or province, although, perhaps, not

N 2

affecting any interests beyond them, becomes thus interesting, as affording evidence of a return to former prosperity, and of the consequent cessation of the causes of decay, while it is reasonable to anticipate that the more this local improvement manifests itself the more chance there is that the nation generally will become alive to its real commercial interests and prosperity.

General Statistics.—Spain is essentially an agricultural country, and is consequently in a great measure dependent upon the produce of the soil.

The superficies of the continental portion of the Kingdom contains 494,946 square kilometres, and three-fourths of the population on this surface are employed in some species of rural industry. Such being the case, the state of the population is of vital importance to the prosperity of the country.

Population.—At the beginning of the century the population in round numbers was 10,000,000, and it is now over 15,000,000, or in the proportion of 30·9 to the square kilometre. I have taken the census of 1860, as I have found it more detailed than others. The following Table shows the superficies, and the number and proportion of inhabitants in each of the forty-nine provinces of the Kingdom :—

Provinces.	Superficies in Square Kilometres.	Number of Inhabitants.	Proportion to Square Kilometre.
Alava	3,122	97,934	31·4

Zamora	10,710	248,502	23·2
Zaragoza	17,112	390,551	22·8

The fluctuation of the population at different periods is remarkable. It is asserted that in the thirteenth century it amounted to 30,000,000, and decreased in the fourteenth to 21,000,000; but there does not seem to be any certain data for this statement, although doubtless during the Moorish occupation it was considerably greater than it has been ever since. Supposing that in the year 1380 it reached 20,000,000 between that year and 1594, when it numbered 8,206,791, it decreased more than 11,000,000. However uncertain these calculations may be, there is no doubt whatever that under the "Reyes Catolicos" the population of the country underwent a great change. The expulsion of the Jews deprived the kingdom of more than 30,000 families, and the Moorish extradition is estimated at 300,000.

Many of the principal towns, as Leon, Burgos, and Toledo, were thus deprived of their industrial popula-

tion, and ceased almost to exist. Thus at the end of the eighteenth century no country could present a sadder spectacle. The population had then diminished to less than 6,000,000, and the revenue from 280,000,000 reals to 30,000,000. The land had gone out of cultivation and industry had perished. The extortion of the priesthood appears almost incredible. The Archbishopric and ecclesiastical establishment of Toledo alone were worth 6,000,000*l.*, but that once flourishing city was prostrated; the iron grasp of the Church stifled it, and drained its life's blood. From 200,000 inhabitants the population had sunk to 25,000; and yet although Spain had been reduced to such an apparent state of ruin, it is said that at the beginning of the seventeenth century a third of the whole resources of the then wealthy Court of Rome came from this poverty-stricken country.

The commencement of the present century, notwithstanding the political crisis which accompanied it, has, however, been marked with decided improvement; although the census of 1846 gave 12,162,874, and that of 1850 only 10,942,280, still that of 1857 resulted in 15,464,340, which is an increase in ninety years of more than 66 per cent.

Agricultural Produce.—The effect of this increase of population has been that Spain now produces 66,000,000 hectolitres of grain instead of only 38,000,000. Fifty years ago France, with a population of 29,000,000, produced 50,000,000 hectolitres; and Spain, say with 10,000,000, 38,000,000 hectolitres. In 1863 France produced 116,000,000 hectolitres, with an increase of population amounting to 8,000,000, and Spain 66,000,000 hectolitres with an increase of population amounting to 5,000,000. In both cases the increased production is remarkable, and in both cases the diminution of the price of grain was inevitable. Any system of legislation which tends to stimulate agricultural industry must be considered as beneficial, and there is no doubt but that the monopoly of the Colonial market, which has hitherto been secured by exorbitant differential duties, has given that stimulus to the corn-growing provinces of the mother country. In 1862 Spain exported to the Island of Cuba and Porto Rico 3,065,925 arrobas of flour exclusive of grain, but the high remunerating prices of a fictitious market were of course regarded as the peculiar privilege of a favoured

interest. However fallacious the principle, the practical result has been beneficial; beneficial, as is shown by increased production; fallacious, as is shown by the fact that the Government have lately found it absolutely necessary to reduce those duties for a time, in order that the Colonial market, as regards the mother country, should not entirely be destroyed, and in the hope by this means of recovering the high remunerating prices of a few years past. The Spanish producer invariably demands of the Government the continuance of high protective duties as regards his own particular interest, or the creation of a monopoly whereby he is enabled to regulate the prices at discretion, and such is the influence which these local interests exercise that they seldom fail to obtain from the Government their object.

The great corn-growing provinces are the Castilian, and they contain, perhaps, some of the finest districts in the world, the returns not only being large, but the quality extraordinarily good. Before, however, speaking in detail respecting them, I will give a statement of the distribution of the land under cultivation in the whole Kingdom. I have before stated the superficies of the Continental provinces contains 494,946 square kilometres, but as that of the Balearic and Canary Islands is always included in all statistical information, it must be taken at 507,036 square kilometres, or 50,703,600 hectares (126,759,000 acres).

This surface is distributed as follows :—

				Hectares.
Cereals, fruit trees, gardens..	882,271
Vineyards	43,433
Olive grounds..	49,922
Meadows	176,424
				<hr/>
				1,152,050
Wheat-growing lands	12,158,240
Vineyards	1,133,402
Olive grounds	809,483
Pastures	6,676,219
Mountain lands	4,385,721
Waste lands and quarries	1,451,922
				<hr/>
Total	26,814,987

Equal to 67,037,450 acres.

which leaves unproductive 24,388,485 hectares

(60,971,200 acres) of the whole superficies. Now it would seem from these figures that there are not more than 13,000,000 hectares (37,500,000 acres) under grain cultivation. If the estimated produce, therefore, of 66,000,000 hectolitres is correct, the average per acre would be a little over 5 hectolitres, equal to about 10 bushels. The paucity of population is of itself sufficient to account for such a limited produce in a country possessing such natural advantages, both in climate and soil, as Spain. The Spanish agriculturist has, however, at the same time great disadvantages to contend with. The want of internal communication in many districts is such that it is impossible to bring the produce to a remunerative market, and the consequence is, that in some provinces when the harvest is plentiful large quantities of grain are wasted, of which even the neighbouring ones are in actual want. Even the few main roads which exist are insufficiently provided with bridges, and it is not an uncommon sight to see eighty or ninety "carros" or country carts laden with agricultural produce detained on the banks of a flooded river until able to ford, sometimes for three or four days. It is, however, in districts where no roads exist, and where all transport is performed by means of mules, that the foregoing remarks more particularly apply. Fifty years ago the internal communication was entirely carried on in this manner, and few, if any, roads existed. What has since been done must, therefore, be regarded rather as the commencement of future and more extended improvements, than as showing any great energy in carrying on the work of road-making.

At the end of the year 1860 there were in existence 11,276 kilomètres of main road ("carreteras") divided into three categories as follows, 9,097 kilomètres first class, 1,550 kilomètres second class, and 629 kilomètres third class, and in course of construction 4,276 kilomètres. The amount expended during the years 1861 and 1862 on roads was 294,716,570 reals vellon (2,947,165*l.*).

The work of opening up the internal communication of the country is progressing slowly, but sufficient importance is not attached to it as benefiting its productive resources. The small amount of traffic on the lines of railway is, perhaps, the best proof of this.

The intermediate stations are deserted. No business appears to be carried on, and one or two passengers, perhaps the priest or village alcalde, give the only signs of life. The mass of the produce of the country cannot be brought to the great lines of railway at present, and until greater facilities are afforded for doing so, not only will the railway companies suffer, but the benefit of the construction of the lines will be lessened, and their civilising effects on the population lost. These remarks apply more especially to the Castilian provinces, and to New Castile in particular. The soil of this province, which includes in its territorial jurisdiction those of Avila, Guadalajara, Segovia, and Toledo, is excellent, and generally speaking most fertile. It is, however, subject to intense droughts during the summer months, and from want of proper irrigation many crops for which the soil is admirably adapted cannot be grown at all. The supply of water in the higher lands, which is by no means deficient, could easily be made available in the plains by a skilful system of irrigation. There is a great field open for enterprise in this respect, and some English capitalists have lately turned their attention to it, with a view of extending operations, which have already met with considerable success. The advantages of irrigation are too apparent even to the Spaniard not to be recognised, and although in general the people regard all undertakings and operations carried on by foreigners with great jealousy, and consider them in the light of innovations detrimental to their interests, this feeling does not appear to exist to such an extent as regards the works in question. The summer droughts in this province have, doubtless, been greatly increased by the destruction of the timber, whereby vast tracts of country have been gradually deprived of the natural humidity engendered by the vicinity of wooded districts. At the present time there is scarcely a tree or shrub to be seen with the exception of a few spots which have escaped the general destruction, and some Royal residences where the trees which exist now afford proof of their former abundance in the country.

The small produce of grain in this province, in comparison with the extent of land capable of producing it, may be accounted for, however, chiefly by the fact that for centuries its wealth consisted in live

stock, the breeding and tending of which formed the sole occupation of the population. From returns, it appears that in the sixteenth century 3,000,000 of merinos were annually sent for pasturage into Estremadura from the Provinces of Avila and Segovia alone, and it may be presumed that those of Madrid, Guadalajara, and Toledo, were not less productive of live stock. The constant emigration of the inhabitants into neighbouring districts, and the unsettled habits which such occupations naturally produced, were not conducive to agricultural pursuits, and although the sheep have considerably diminished in numbers in consequence of diminished profit, the people retain much of their former pastoral character, and an undue proportion of the land remains in consequence uncultivated.

The quantity of live stock in Spain is calculated as follows :—

Cattle	1,380,861
Horses	268,248
Mules	415,978
Sheep	13,794,959
Asses	491,690
Pigs	1,013,383

I have taken the returns for the year 1860, as I am unable to ascertain that there has been any considerable increase or decrease since that period. Of this quantity the northern provinces furnish the largest proportion.

In a list of market prices published in 1847, I find the following articles enumerated as the produce of the Province of Madrid proper :—Wheat, barley, oats, rye, peas (garbanzos), haricot beans, potatoes, turnips, all kinds of garden vegetables; fruit of all kinds, fresh and preserved; hemp, flax, coal, wood, wine, vinegar, Esparto grass, &c. But I must remark, as far as I am able to judge, the quantity is limited; as, with the exception of the straw crops, almost every other article above-mentioned comes from the adjoining provinces. The Esparto grass, although not much grown in this province, has of late become an article of export of considerable value.

This grass, which grows wild in almost all parts of Spain, resembles very much the common spear grass which is found on the sandy sea shores of Lancashire.

Its botanical name is, I believe, "*Stipa tenacissima*." It has been long used in Spain for making matting and cord, baskets, &c., and appears to have been used for such purposes by the Phœnicians, who gathered it in large quantities from the coasts of Spain. It was not, however, until lately that its adaptability for paper-making was discovered, and that its value in consequence became so much greater. Mr. Consul Mark informs me that 160,000 tons were imported into England from the Spanish and African coasts last year. Mr. Consul Turner reports that large quantities are shipped from Carthagena, and that in 1863 it was selling for the fabulous price of 4*l.* 10*s.* per ton. It appears, however, that in the districts where it is most abundant, there is great difficulty in getting it to the coast for shipment, and that oftentimes the expense of transport would exceed the cost price of the article. I am told that no less than 80,000 women and children are employed in the country between Alicante and Carthagena in the production of articles made from this grass, and that it is shipped in large quantities in a prepared state ("*Esparto labrado*") to both France and England. Mr. Vice-Consul March reports that, although not much attention has hitherto been to the *Esparto* grass in the district of San Sebastian, he is of opinion that now that communication with the interior is made easier, shipments will take place both at that port and the neighbouring one of Pasages. Its cultivation has never been tried, but there seems great probability that the qualities of the stalk would be greatly improved, and its size increased, whereby its value would be greatly augmented for all purposes. It grows where no other plant will grow, and is most abundant near Almagrera, growing on the igneous mountains, and amidst sterile rocks.

Revenue.—The amount of revenue raised from real property ("*Immeubles Cultivo y Granaderia*") in the whole kingdom during the five years ending 1864 was as follows:—

					Reals vellon.
1860	492,986,056
1861	488,691,768
1862	494,283,707
1863	509,080,752
1864	544,497,653

And as these taxes are raised partly on profits,

the increasing revenue is proof of increasing production.

Mines.—According to Returns published in 1860 there were in Spain 12,079 mines, consisting of zinc, topaz, soda, salt, lead, petroleum, iron pyrites, arsenical pyrites, nickel, manganese, lignite, tin, cinnabar, copper, cobalt, coal, alum, sulphur, quicksilver, gold, asphalt, antimony, alcohol, and carbonate of zinc. Lead is abundant in the provinces of Almeria and Murcia, and copper in Huelva. Guadalajara, Almeria, Granada, and Murcia furnish silver, and coal is found in abundance in the basins of Langreo and Ciaño, in the Asturias, in that of Espiel and Belmez de Cordoba, in various parts of the Catalan provinces, and in the basins of Ubrilla and of Gargollo, in Teruel.

In the year 1858 the quantity of coal raised appears to have been 170,000 tons, and the importation is put down at 300,000 tons; but I am unable to vouch for the accuracy of these Returns, and am endeavouring to obtain later and more reliable ones. The legislation with regard to mining operations appears to be capable of much improvement, in the way of removing obstacles to private enterprise, and of encouraging the investment of capital by granting extensive and liberal concessions.

Many of the mines, which, if properly worked, would afford a rich yield, are almost abandoned, and the extensive works of former generations which attest the mineral wealth of the country appear to offer but slight inducement, either to the Spaniard or the foreigner, for following them up. In some of the mining districts, as, for instance, Adra, greater activity appears.

The lead ore of the limestone mountains forming the Sierra de Lujar and the Sierra de Gador is worked to a considerable extent, as well as the zinc ore or carbonate of zinc. Mr. Consul Mark states that, at the most flourishing period of these mines, the exportation was more than double what it is at present, having reached the enormous figure of 40,000 tons per annum.

The export of lead from the Gador mines may be stated at from 350,000 to 400,000 quintals, or about 200,000 tons annually. The export of silver from 6,000 to 9,000 lbs. During the year 1863 Mr. Mark gives the returns as follows :—

Lead	341,961 quintals.
Galena	35,938 „
Silver..	6,600 lbs.
Calamine	77,920 quintals.

But as this is one of the richest and best explored mining districts, it cannot be taken as an example of the system pursued in other districts, which, although rude, even in that of Adra, is still more so in others. Spanish mining operations have been, perhaps, more exposed to the injurious effects of the spirit of inordinate speculation than those of other countries; and the reported discovery of a lode of ore creates the same sensation among speculators as the lottery ticket, whose number the possessor fondly imagines is to win. Thus concessions have been granted, and works undertaken, which have ended in disappointment and failure.

Cotton Manufactures. — The chief manufacturing interest consists in the cotton manufactures of Catalonia, a local interest which has hitherto succeeded in resisting all attempts on the part of the Government to modify the existing rates of duty. This industry employed about 100,000 people in 1861, and there were 1,000,000 spinning machines in work. During the five years ended 1860 Barcelona imported cotton as follows :—

	United States.	Brazil.	Venezuela.	Porto Rico.
	Bales.	Bales.	Bales.	Bales.
1856	124,968	21,092	1,305	1,169
1857	72,376	9,913	..	28
1858	92,578	10,620	916	676
1859	108,156	3,711	148	15
1860	110,283	4,547	344	..

The importation in 1863 fell off to 105,920 bales, and the subsequent depression of the trade was most severely felt in this province, although the mills were kept open by supplies, from Marseilles and Cette, of Levantine and Egyptian cotton.

The British trade with Barcelona, which may be considered the commercial capital of Spain, has gradually fallen off, and with the exception of coal and machinery the imports are small. The great trade consists in smuggled French goods, which are introduced under Spanish marks, and such is the influence

of those concerned in this trade, and such the fear which these provinces inspire by their revolutionary tendencies, that, as I have before remarked, all efforts to modify the existing almost prohibitory tariff have proved of no avail. If this system could be abolished, both the interest of the smuggler and he who supplies the smuggled goods would cease, and a fair market be opened. The whole country is affected by a system based upon fraud and venality. Its demoralizing effects are everywhere apparent, and the financial condition of the Government is seriously compromised by it. These facts are recognized by all intelligent Spaniards who, however, assert the inability of any Government, under existing circumstances, satisfactorily to deal with them. The political organization of parties is such that any serious consideration of the subject of commercial reform would not only create alarm, but produce divisions which would render it impossible to carry on the Government under such circumstances; all that can be looked for is a gradual relaxation of the system, and perhaps an appreciation of the advantages arising therefrom, which sooner or later will awaken the nation to their true interests.

With the exception of foundries and refining establishments in the mining districts, and a few china and crockery manufactories, there is no other branch of national industry worth mentioning. Speaking of the former industrial prosperity of the provinces of Madrid, Avila, Segovia, Toledo, and Guadalajara, M. Madoz in his work upon Spain says, "In former times the manufacturing industry of these provinces employed thousands of hands. Toledo possessed numbers of needle manufactories, and more than 600 cap makers (gorros), besides innumerable woollen tissue works. It was famous also for its silks, and especially the tissues of Talavera de la Reina were highly prized for their fine quality; and last, not least, it was renowned for the celebrated Toledo blades. The fine cloth manufactories of the province of Segovia were once held in great esteem, but for the last century and a-half their value has declined, and now nothing is made but the coarser articles. More recently attention was called to the fine woollen cloths of San Fernando, Guadalajara, and Brihuega, which exceeded in quality the best English articles: but the expense

of the manufacture, owing to the want of proper machinery and the application of modern economical inventions, rendered competition impossible, and the establishments finally closed. At the present time nothing but coarse fabrics are made. The province of Avila was formerly the greatest manufacturing one of the whole kingdom, and its productions were held in the highest estimation in the principal markets. After the expulsion of the Jews, who formed the manufacturing class, all industry ceased, and remained dormant until the commencement of Phillip V's reign. Both he and Charles III made great efforts and spent large sums in endeavouring to resuscitate the cloth manufactures, but all in vain . . . and Avila is at present reduced to making common woollen and linen articles for local consumption. With the last century disappeared in almost all its branches the manufacturing industry of these four provinces, the arms of Toledo and the silk of Talavera alone remaining." The same observations apply more or less to the other provinces. Such being the case, it would seem paradoxical to assert that Spain has made any progress during the last fifty years, and yet the nation is in a far more prosperous condition than it was when the manufacturing interests which have been alluded to were much more thriving. These interests were fostered by natural advantages, which for a long period of time secured a monopoly of the European market. The superiority, however, which these natural advantages afforded, gave way before the spirit of enterprize and improvement of other nations, with which, by force of circumstances, Spain was brought into contact. Her commercial policy was based upon the principle that there was but one country destined to supply foreign markets, and that country was Spain. The character of the people also rendered them incapable of appreciating the beneficial effects produced in other countries by a free interchange of commodities; but they saw with that intense jealousy which characterises them, that Spain could no longer compete in industrial pursuits with those who had been once so far her inferiors. In what, then, does the progress she has made consist? I believe it will be found to be in the increased development of her natural productions, consequent upon and concomitant

with the increase of population; and it is upon the progressive movement of both the one and the other that her future prosperity depends. I have come to this conclusion from a perusal of the articles of export, and from observing an increase in them. Among the chief are olive oil, spirits, saffron, leather, coal, meat, cork, dried fruits, grain, vegetables, seeds, flour, soap, wool, metals, minerals, pastes, salt, wine, silk, skins, &c. In 1862 I find a marked increase over the five previous years, in spirits, saffron, coal, cork, fresh fruits, grain, soap, wool, metals, minerals, salt, wine. The value of the exports in 1862 is thus given in the official returns :—

			Reals vellon.
Under national flag	..	.	473,140,652
Under foreign flag	530,351,142
By land	107,040,476
			<hr/>
			1,110,532,270

The exportation under foreign flag and by land shows an increase over the five previous years of 34,411,891 reals vellon, while that under the national flag a decrease of 30,415,282 reals vellon over the same period, which latter fact is simply accounted for by the high duties hitherto levied on all materials for ship-building.

Now it is to be remarked that almost all the articles above-mentioned are natural productions, and that scarcely one can be classed under the head of manufacturing industry. The exporting capabilities of a country may generally be taken as indicating the nature of its internal resources, and although it may manufacture to a certain extent for home consumption, yet while it exports almost exclusively natural produce, it is upon that its commercial progress must depend; and so much so is this the case in Spain that the improvement which has taken place in the revenue has been accompanied by the decline of the manufacturing interest, which flourished formerly when it had no competitors, and which only exists now by prohibitory duties. Manufacture in this country is synonymous with the creation of monopolies by the imposition of exorbitant Customs dues, and the enriching of the few at the expense of the many. It must be under a different system of commercial legislation from that which prevails at present that

manufactures can flourish, but I believe that, although there is no reason why Spanish industry should not compete successfully in the European market, still the attachment to old ideas and theories of commerce is such as effectually to cripple its development to any extent, as has been shown in the last half-century.

The following commercial statistics are those published in 1861 :—

				Value of the Foreign Commerce.	
				Imports.	Exports.
Europe—				Reals vellon.	Reals vellon.

Grand Total	2,020,593,787	1,269,500,460

The total value of the imports and exports combined at the several ports in 1860, was :—

					Reals Vellon.
Barcelona	434,432,000
Cadiz	301,966,000
Santander	267,607,000
Alicante	238,102,000
Malaga	222,076,000
Seville	153,304,000
Bilbao	142,535,000
Valencia	100,506,000
Santa Maria	62,080,000
Carthagena	60,062,000

					Reals Vellon.
Palma	48,351,000
Irun	46,032,000
Tarragona	42,192,000
Corunna	42,080,000
Adra	23,247,000
Vigo	17,165,000
Almeria	17,391,000
Ferrol	16,008,000
Gijon	13,775,000

The approximate value of the different articles of export may be stated as follows :—

					Reals Vellon.
Wine	323,216,627
Metals	149,233,837
Dried fruit	105,527,908

The future commercial prosperity of Spain depends so much upon its political regeneration, that it is almost impossible to assert that the improvements which I have endeavoured to show have taken place of late years will continue. There are many financial questions, the unsatisfactory state of which, owing to political differences, has had and continues to have a most injurious effect, not only upon its exterior commercial relations, but upon its interior industrial transactions; and until some solution be found which would re-establish the national credit abroad, and inspire greater confidence at home, no further progress can be hoped for. This situation is most unfortunate. It is impossible not to perceive how the prosecution of industrial enterprise is impeded by want of capital for the extension of railways, the irrigation of land, and other important works; and that Spain, by the policy hitherto pursued in regard to these questions, is not

only shut out from all European money markets, but is actually losing the opportunity of obtaining capital upon most favourable terms. By an equitable adjustment of them, therefore, the credit of Spain, to use the words of a distinguished Spanish statesman, " would be raised to the level of the first nations of the world. The markets of Europe would be open to us, and foreign capitalists would be induced to invest in multitudes of enterprises which would open up all the branches of our national wealth."

(Signed) L. S. SACKVILLE WEST.

Baden.

Report by Mr. Baillie, Her Majesty's Secretary of Legation.

Baden, July 1865.

THE state of trade and industry in the Grand Duchy of Baden during the past year, though it has not been unaffected by those causes which have acted injuriously upon the general trade of the Zollverein, was on the whole satisfactory.

Increased activity has been observable in every branch of industry, and a considerable addition to the number of commercial firms, especially in the town of Mannheim.

The trade in colonial goods has increased so rapidly since the Zollverein was first established that Mannheim now takes the first rank among the commercial towns of South Germany.

According to the Custom-house returns, the duties annually raised there amount to nearly 1,800,000 florins; the goods on which duty has been paid, to above 600,000 centners: of this about 80,000 centners coffee, yielding 700,000 florins duty.

In addition to this, an almost equal amount is sold from Mannheim houses direct to Austria and Switzerland.

The trade to Mannheim extends over Baden, Wurtemberg, Bavaria, Hesse, the provinces on the left bank of the Rhine, and even to Austria, Switzerland, and Italy.

The commercial interests of Mannheim are closely bound up with the navigation of the Rhine, which is still burdened with high tolls and dues.

When these are removed or reduced, as may shortly be expected, and further facilities are granted on the railways, the prosperity of Mannheim will increase still more, and this port will then be enabled to enjoy the full benefit of its naturally favourable

situation as commencing point and terminus of the larger Rhine navigation.

Importation.—The imports of the following articles decreased during the past year :—

Raw sugar, raw iron, iron and steel, wine, woollen and silk goods.

The raw sugar imported last year for the Zollverein refining establishments did not amount to three-fifths of that in 1863.

The decrease in raw iron is attributed to the high prices in England, and the consequently larger demand for Zollverein iron.

The imports of iron rails, which were very large in 1863, were greatly reduced in 1864.

The diminished imports of wine and other articles were owing to the expected Tariff reduction under the Franco-German Treaty; merchants and others supplying themselves with what was merely sufficient for their immediate wants.

On the other hand, the imports of raw coffee, and other raw products, increased during last year; also coarse iron wares and unprepared tobacco leaves.

The coarse iron was required in the construction and extension of factories.

The demand for tobacco leaves is rapidly increasing for the cigar manufacture, which is now carried on on a large scale in Baden.

Exportation.—The returns show very little change for the past year. The civil war in America, unfavourable exchanges, and increased import duties in that country, have rendered the American market very difficult of access to German products; but Baden industry has, in common with the Zollverein in general, found other markets for its products and manufactures, and become much more independent of the United States.

Agricultural Produce.—Hops.—The hop trade in Baden is of great extent and importance. It is carried on in Mannheim by twenty firms, and the business amounts to about 20,000 centners annually, with a capital value of about 2,000,000 florins.

About half this amount goes to Bavaria, Bohemia, France, England, Spain, and Portugal, and the other half is consumed in the country and in the other Zollverein States.

The three first-mentioned countries import the best kinds of Baden hops; England is the chief consumer of the more ordinary sorts.

The large hop trade to Bavaria and Bohemia is the result of the improvement in the cultivation of hops in Baden, which has taken place of late years.

The exports to France have been confined within narrow limits, owing to the high French import duty of 59 francs 40 centimes per 100 kilogrammes, but the reduction of this duty to 20 francs per kilogramme, under the Franco-German Commercial Treaty will greatly contribute to their increase.

Baden produces in good years 23,000 centners. The harvest last year was an indifferent one, and only yielded about one-half that quantity.

The price of hops in Baden at the time of the greatest demand was 100 to 140 florins per centner.

Tobacco.—In each of the years 1863 and 1864 the tobacco produced in Baden amounted to about 400,000 centners; the prices varying from 9 to 16 florins per centner.

Great attention has been paid of late years in this country to the cultivation of this plant, and the value of the product has in consequence much increased.

About half of the tobacco produced is brought up by the Mannheim merchants. The trade extends to the Zollverein, England, Spain, Algiers, and now to Belgium, and frequently to Austria, France, and Italy for their "Régies."

The value of the business in Mannheim amounts annually to about 4,000,000 florins.

The production of tobacco is under no restrictions in Baden, and furnishes a lasting and remunerative employment to a large number of the poorer classes.

Cigar Manufacture.—This branch of industry first commenced in Baden about thirty years ago, and for a long time had great difficulty in sustaining a competition with the north of Germany.

The manufacture of cigars has, however, now so much improved that an article is produced in the Mannheim establishments capable of successfully competing with the cigars from the northern seaports.

About 3,000 workmen are employed in Mannheim in this business.

Last year about 170,000,000 cigars were produced there, to the value of nearly 2,000,000 florins.

The use of foreign and tropical tobacco has much increased in the Zollverein of late years.

Mannheim cigars, made of colonial tobacco, find a steady market, especially in the Zollverein and in Switzerland.

By far the largest part of the cigars made of tobacco grown in the Palatinate is exported to distant countries. A few years ago the exports to the United States attained a very high figure. They have now greatly diminished, owing principally to the almost prohibitive import duty in that country.

The wages of workmen employed in the Mannheim cigar manufacture amounted last year to 500,000 florins; cigar boxes, &c., to 170,000 florins.

The Baden Society for tobacco cultivation and trade transacted business last year to the amount of 300,000 florins.

In 1863 their harvest yielded 14,600 centners dry tobacco.

They employ about 250 workmen, women, and day labourers. Wages amounted to 70,000 florins.

In other Karlsruhe establishments about 11,000,000 cigars, 10,000 centners of tobacco and snuff, were manufactured, most of which were exported to Switzerland and the States of the Zollverein, and upwards of 200 workpeople employed.

According to the Returns in 1861 there were in Baden, at the end of that year, 168 tobacco and cigar factories, employing 1,444 men and 2,088 women.

Coal Trade.—In the past year 2,785,160 centners of coal were unloaded in Mannheim. Reckoning the coals conveyed by railway, the total amount of the coal trade was 4,500,000 centners.

Wood Trade.—This important branch of trade underwent a change for the worse, as compared with the preceding year: 1,210 floats, with 2,224,493 centners of wood, however, arrived in Mannheim during the last year, besides very considerable quantities of sawn wood, planks, boards, frames, &c., chiefly conveyed by rail.

Petroleum.—The trade in petroleum increased to a remarkable degree in 1864. The imports of this article amounted to 51,699 centners, and in 1863, 25,361

centners. This trade extends to Baden, Wurtemberg, Bavaria, and Austria.

Sugar Manufacture.—The raw material chiefly employed in the manufacture of sugar in the working year 1863–64 was beet-root, and only a small amount of Indian raw sugar.

The trade in the different kinds of sugar produced in Baden is entirely confined to the States of South Germany. Scarcely any refined beet-root sugar is exported abroad.

The South German refining establishments, and especially the Baden, have to sustain a sharp competition with those in the north of Germany, owing to the facilities which the latter enjoy in consequence of the railway charges for the conveyance of sugars having been reduced on the central German lines, whereas no such change has taken place on the Baden and Main Neckar Railways.

The following is a statement of the business carried on in the Waghäusel establishment and its branches for the year 1863-64 :—

Beet-root harvest	1,496,207 centners
Consumed fresh beets	1,359,638 „
Purchased raw sugar	8,300 „
Molasses for spirits	58,430 „
“ Schlempe ”	72,246 ohm
Limestone	881 kreutzers
Barley for malt	2,292 centners
Charcoal, “beinschwarz,” and other ingredients for artificial manure	2,628 „
Coals for gas	20,757 „
Bones	32,059 „
Beet-root leavings for fodder	94,190 „

EXPENDITURE.

Coals	495,420 centners
Coke	313,673 „

In Waghäusel factory	1,517	
Drying houses	1,448	
Farm	1,577	

After termination of drying process, employed in Waghäusel factory 1,168 workmen.

It will be perceived from the above statement, that notwithstanding the difficulties with which this industry has to contend, it is carried on in Baden on a large scale; and it seems probable that with the increasing development of the Zollverein sugar manufacture, foreign sugar will be gradually expelled from the Zollverein market altogether.

The receipts derived from the import duty on foreign sugar, and the tax on beet-root sugar, are very considerable.

The latter are collected into a common fund, and a fair proportion according to the population distributed to each Zollverein State.

They amounted from the 1st September, 1862, to

the 31st August, 1863, to 8,856,283 thalers; from the 1st September, 1863, to the 31st August, 1864, to 9,128,074 thalers.

Candle Manufacture (Stearin Kerzen).—This branch of industry appears to have been, for the present at least, nearly ruined by the indirect operation of the Franco-English Commercial Treaty.

Under this Treaty the import duties on the raw materials necessary for the manufacture (tallow, palm and cocoa oil) have fallen away in France, and have been subsequently removed in Belgium and Holland. They have been allowed, however, to remain on the Zollverein Tariff.

The German export trade in candles has been consequently brought to a standstill; being no longer able to compete with France, and still less with Belgium and Holland.

The duty on tallow is indeed removed by the Franco-German Commercial Treaty; but on the other raw materials it remains as before.

The import duty on candles in the Zollverein was fixed at $1\frac{1}{2}$ thalers (2 florins 37 kreutzers). In France at 10 per cent. *ad valorem* (equivalent to from 5 to 7 florins per centner). Holland and Belgium levy as much, and Switzerland still more.

The German candle industry, which before exported its products to distant countries to a large extent, is thus excluded from every market.

There is a large manufactory of these candles in Mannheim, provided with steam-engines and hydraulic presses and other machinery for soap boiling and tallow candles. The production in the past year amounted to 1,500 centners composition candles, 1,000 centners soap, 300 centners tallow candles.

With the actual arrangements of the establishment more than double this amount might be manufactured, if commercial legislation permitted.

Commercial Treaty with France.—This Treaty, which has now come into operation with the reconstruction of the Zollverein, will be of very great importance to the commercial and industrial interests of Baden, especially when followed up by the various projected Treaties with those States which have already similar Conventions with France.

It will open up a wider field for industrial enter-

prize, and facilitate a closer connection with the trade of the world.

The Treaty with Switzerland, which has been negotiated by Bavaria, Wurtemberg, and Baden, in behalf of the Zollverein, is of special interest to Baden from the close connection with Switzerland as a neighbouring State.

The Swiss import duties being low and fixed on free trade principles do not give much cause for the expression of any particular wishes on the part of Baden; but it is very important to Baden to secure various facilities of intercourse between the two countries, such as reduction of the charges for letters and carriage, telegraphs, mutual protection of industrial and literary property, and equal rights in regard to domicile, irrespective of religion.

It seems unfortunately probable that some delay may still elapse before this Treaty is carried into effect, and the same may be said in regard to the projected Treaty with Italy, which is strongly opposed by those States which sympathize with Austria on the ground that it would involve a practical recognition of that Kingdom.

It is, however, not very likely that either political intrigue or any other cause will long prevail so as to retard the carrying of a policy so important to the general interests of the country.

(Signed) EVAN P. M. BAILLIE.

Persia.

*Report by Mr. Dickson, Her Majesty's Secretary of
Legation.*

Mr. Dickson to Mr. Alison.

Sir, *Gulahek, July 3, 1865.*

AS already explained in previous Reports, it is extremely difficult to obtain correct information on the commerce and finances of Persia, no statistics being published by the Government, who indeed have hitherto evinced very little interest in the development of the commercial resources of this country. It is a subject which has as yet to be studied by Persian Administrators. In the meantime all the obstacles pointed out in the Reports forwarded within the last few years from this Mission and from Her Majesty's Consulate at Tabreez seem likely to remain in force.

The first step towards commercial prosperity, the construction of roads, has not yet been seriously considered. The attention of the Persian Government has, however, been repeatedly drawn to this important subject, and the Shah was at length induced to have a carriage road made, as a trial, from the gate of his palace in town to one of his summer residences, a distance of about six miles. It was greatly hoped that this work would lead to others of a more extensive nature, but as yet all that has been done has been to widen one of the paths leading into Mazanderan, with the view of affording an easier access to that province, whence timber and charcoal are conveyed on mules to the capital. An Armenian gentleman also succeeded a few months ago in obtaining a concession of the right of making a road from the Persian frontier, on the Araxes, to Tabreez, but he has not since been heard of. This undertaking, if carried out, though insufficient for the requirements of this country,

would still be a step in the right direction, and would, at any rate, greatly stimulate the trade of Tabreez.

The Russian Government are said to have determined on constructing a railroad from Poti to Tiflis. When this project is carried out it will no doubt be followed by branch railways to the Persian frontier and to the Caspian. Russia will then not only secure the transit trade of Persia, but render that transit trade vastly more important by the facilities which the improved means of communication will afford.

Rich in minerals, capable of producing grain, cotton, silk, and wool to any extent, possessing immense forests whence the finest timber might be obtained, it is to be regretted that the little needed to render Persia a highly flourishing country should be withheld; I mean a better system of administration, under which her peasantry might feel less insecurity, and cart-roads, whereby a cheap and easy outlet would be obtained for her productions, to the Caspian Sea and to the Persian Gulf. But so long as these important reforms are neglected, and whilst the system lasts of farming out the Customs and of checking trade by a variety of vexatious internal tolls, the resources of this country must necessarily remain undeveloped. This is the more to be regretted, as Persia has acquired a great taste for British manufactures, and every step towards prosperity would therefore be followed by a proportional increase in the consumption of those goods.

There is every prospect of the approaching harvest being an abundant one, and it is to be hoped that food will be cheaper than it has been for some years past. In Fars the crops have been for the last two years unusually fine. The Persian Government were nevertheless disposed to prohibit the exportation of grain from Bushire, to the great annoyance of British traders; but through the exertions of your Excellency the impediment was finally removed.

The great demand which arose for cotton in consequence of the American war seems to have encouraged the cultivation of that article in the Province of Fars, and the inclosed return received from the Acting Resident at Bushire shows that the exportation of cotton from Southern Persia has increased since the years 1862-63 five-fold.

On the other hand, the state of the cotton trade at Astrabad does not appear to have been satisfactory. The British Agent at that place reports that cotton has fallen much in price ; it being now 8 kerans, or about 6s. 6d. per maun of 15 lbs., and that there are no buyers. The Persian and Russian merchants, who were in the habit of purchasing large quantities from Mazanderan, Astrabad, Semnoon, Damghan, Shahrood, and Khorasan, will not at present lay out a penny in buying cotton, and a considerable quantity remains, therefore, laid up in store.

The opium produced at Yezd is said to be of excellent quality, but exporters have of late so adulterated it that it is said the whole quantity which has this year been sent to China will probably be returned.

A French gentleman came out last year to make inquiries as to the quality of opium produced in Persia with a view to supplying the hospitals in France. He expressed himself highly satisfied with the result of his investigation, having found the best Persian opium to contain as much as 17 per cent. of morphine, but that it would be necessary to take great precautions in purchasing to prevent adulteration. The continued fall in the prices of this article in Europe have deterred him from making as yet any purchases. He left for France a short time ago to communicate with his employers on the subject, but is expected to return to Persia this autumn.

Persia possesses a variety of fine breeds of horses, and annually exports a considerable number to India. The price here varies from 12*l.* to 50*l.*

Her Majesty's Consul at Resht reports that serious apprehensions are entertained for the success of the approaching silk crop, on account of the unhealthy condition of the worms. If these fears should unfortunately be realized, the import trade of Tabreez—which consists chiefly of British manufactures—will no doubt be thereby seriously affected, as merchants depend mainly on the silk trade for their returns to Europe. This evil may, however, be partly counter-balanced by other circumstances of a favourable nature, such as the successes obtained last winter by the Persian army over the marauding Toorkoman hordes near Astrabad, thereby restoring tranquillity to that province and to the neighbouring one of Khorasan ;

the favourable state of the crops throughout the Empire; the late changes in the Ministry. All these circumstances will no doubt tend to improve the condition of the people, inspire confidence, and benefit trade.

The currency of Persia continues in a deplorable state. There is hardly a gold toman in the country that is not clipped and short of weight, and fraud is extensively practised in the minting of the silver coin; so much so that when specimens were assayed in England it was found impossible to fix a par of exchange with this country. When merchants are obliged to make cash remittances to Europe, they have recourse to Russian currency; but this is rendered scarce by the Directors of the Persian Mints, who collect Russian silver roubles and convert them into Persian kerans and panabats, which are issued with the same amount of alloy as is contained in the Russian roubles; though, according to the standard, the alloy in Persian coins, whether gold or silver, should not exceed 3 per cent. At Sheeraz, the Mint authorities purchase silver rupees at 223 kerans per 100. These are melted down and re-coined into 240 kerans, by which process the Mint makes a profit—or rather defrauds the public—of about 8 per cent. on the value of the silver currency.

This evil might be remedied by the establishment of a National Bank, but Persia is not, I fear, yet prepared for such a boon. A bank could not prosper where life and property are not secure; and the Shah would not, I presume, be at present disposed to renounce his prerogative of punishing his subjects by death, banishment, or confiscation of property, when he sees fit, and without trial.

M. Adolphe de Flerz, a gentleman said to be connected with the house of Oppenheim, came to Persia, about two years ago, with the view of establishing a bank; but after a protracted negotiation, his proposals were rejected by the Shah, and he returned to Europe.

Great anxiety is felt as to the issue of the discussions now pending between Persia and Turkey relative to certain modifications which Turkey wishes to insert in their respective Commercial Treaties. These modifications, if carried out, will prove a serious blow to one of the principal agricultural productions of Persia,

namely, tambakoo. This kind of tobacco grows only in Persia, and, to a small extent, in Egypt. It is extensively cultivated in the provinces of Isfahan and Fars, and forms a great source of revenue. A considerable quantity is exported annually to Turkey, where it is smoked through water, in pipes known by the name of "narghileh." Turkey now insists on subjecting this article to an import duty of 75 per cent. instead of, as heretofore, 4 per cent. When the great distance between the places of growth and the Turkish markets, and the heavy expense attending its long land transport, are considered, there is reason to apprehend that the additional obstacle of a duty of 75 per cent. would virtually put a stop to the exportation, and, to a certain degree, to the production of Persian tobacco, thus causing a heavy loss of revenue to Persia, and misery to a portion of her agricultural population, and even injuring British trade, for Persia depends partly upon the exportation of her tobacco for the payment of the manufactures she receives from England.

According to a report received from the Agent at Meshed, there appear to be in that city 1,500 manufactories of silk goods, which are consumed in different parts of Persia. Meshed likewise manufactures shawls, and draws for that purpose about 6,000 batmans (40,000 lbs.) of wool annually from Kerman. These goods are partly consumed in Persia, and partly exported to Turkey and to Afghanistan. They are imitations of the Cashmere shawls, but of very inferior quality.

Opium is also produced at Meshed, and is exported to Bokhara and Khokand.

The cotton grown in Khorasan is mostly sent to Russia, which sends in return iron, brass, paper, crockery, &c.

I have, &c.

(Signed) W. J. DICKSON.

* One maul is equivalent to 7½ English lbs.

† Purchasers for the Persian market were busy at Isfahan in 1863-64, and exported as many bales as they could to Tabreez, but were outstripped by India traders.

‡ 800 horses went from Bender Abbas.

§ About 100 horses perished at sea in native craft during bad weather.

¶ Fall of prices at Bombay has much depressed market in Persia. But cultivators determined to have a good crop in hopes of a fresh rise.

¶ Crops reported to have suffered, else a larger supply would have been produced.

Unconvenanted Assistant Resident, Persian Gulf.

Portugal.

Report by Mr. Lytton, Her Majesty's Secretary of Legation.

Mr. Lytton to Earl Russell.

My Lord,

Lisbon, July 30, 1865.

IN compliance with the circular instructions for the periodical transmission to Her Majesty's Government of commercial and financial Reports by Her Majesty's Secretaries of Legation, I have the honour to address to your Lordship a short statement representing the principal features of the latest officially declared results of the financial administration of this country. In doing so, I beg permission to mention briefly why it is, I regret to say, out of my power to submit to your Lordship's notice, on the present occasion, any ampler or more detailed account of the financial, commercial, or industrial resources of a country in which, as your Lordship is aware, I have only very recently arrived.

In the first place, I find that the latest official Returns of Portuguese commerce were published in the year 1863, and that these Returns have already furnished the subject of a very careful and complete Report by Mr. Herries. In the second place, after unremitting but fruitless efforts to obtain from various private, as well as official sources, some further information as to the actual condition of Portuguese commerce during the present year, I find that, owing to the fact that the accounts of the national commerce have not yet been officially verified and put together by the Financial Department, it is absolutely impossible, for the present, to add anything of value to the commercial information already published and fully commented upon by Mr. Herries. In the third place, when I turn to those subjects connected with the commerce, industry, agriculture, and fiscal legislation of this country, the interest of which may be deemed more or less independent of statistical novelty, I find that all these subjects have been accurately and ably discussed by my predecessors, upon data to which the material development of the country during my short residence therein has added no new interest.

No event has marked the commercial legislation of

[360]

Portugal since it was described by Mr. Herries in a yet recent Report. Full information has already been furnished by the same gentleman about the mines and mineral resources of this country. The fiscal system and the monetary, the Tariff, the taxes, and the National Debt of Portugal, have all been amply reported on by Mr. Barron, and I am not aware of any new topic which they now present for discussion. The cultivation of the vine, the wine trade, the general agriculture and manufacturing industry of Portugal have also been elaborately examined in various Reports by former Secretaries of this Legation.

The liberation of the Douro wine trade, and the necessity of a more liberal Corn Law, are subjects which have recently, within the last few days, as they have frequently heretofore, been urged upon the serious attention of Parliament in a Speech from the Throne.

The measures relating to these subjects, however, are still in the pigeon-holes of Administrative Departments, or on the tables of Parliamentary Committees. An interesting examination of their details, as well as an able analysis of the circumstances which render these measures of urgent necessity on behalf of the public welfare of this country, will be found in a Report thereupon by Mr. Herries.

Fourthly, and finally, when I turn to the latest official publications for information as to the finances of the present year, I find myself before estimates which have not yet received legislative sanction, and a revenue raised from taxes levied in conformity with the composition of a Budget, of which the details have already been described in previous statements addressed to Her Majesty's Government from this Legation.

It is, therefore, not because my residence in this country barely exceeds two months, nor yet because, during the whole of that period, my time and attention have been chiefly due to those claims upon them involved in the conduct of the political affairs of this Mission, but simply because, in the absolute deficiency of all novel information or recent interest as regards any conceivable subject to which I might have devoted this Report, the insipidity of of its character could only be aggravated by the amplitude of its contents, that I venture to bespeak your Lordship's pardon for the brevity of the few remarks I have to offer on the following Tabular Statement (compiled from official figures) of the estimated revenue and expenditure of the current as compared with the declared revenue and expenditure of the previous financial year.

BUDGET OF PORTUGAL for 1865-66, submitted to the Cortes by the Minister of Finance on the 23rd of January, 1865; as compared with the Budget for 1864-65 approved by the Law of June 25, 1864.

REVENUE.				EXPENDITURE.			
	1864-65 (Approved.)		1865-66 (Proposed).		1864-65 (Approved.)		1865-66 (Proposed).
	Reis	£			Reis	£

Receipts from former years	64,249	Department of Navy and Colonies	1,349,448,759	277,853	1,385,811,421
Total	3,920,906	Foreign Department	189,663,385	42,146	211,860,258
Extraordinary Revenue—				Department of Public Works, Commerce,			
Sums to be raised by the Government by				and Industry	1,324,686,187	294,419	1,370,021,053
loan or by any other means that may				Total	17,337,671,103	3,843,815	17,644,066,908
be more expeditious				Extraordinary Expenditure in the several			
Grand Total	3,998,790,975	735,064	750,931	Public Departments	2,764,160,000	614,708	3,377,398,600
	30,108,631,103	4,467,517	4,671,457	Grand Total	20,102,831,103	4,467,517	21,021,460,408

In estimating at their genuine value the revenue and expenditure represented by the foregoing Tables, we must, I apprehend, throw out of the calculation that item which figures under the head of "Extraordinary Revenue," which virtually means money borrowed in one form or another by various operations of credit.

The whole actual revenue of the year 1864-65, therefore, may be stated in English money at 3,734,453*l.*, which, when compared with the total actual expenditure for that year, brings out a deficit of 733,064*l.* And the amount of revenue estimated for the present year from *bond fide* sources, amounting only to 3,920,906*l.*, shows, when compared with the estimated expenditure, a deficiency of 750,531*l.*, which is 17,467*l.* in excess of the corresponding deficiency in the previous year.

Judging from the financial statistics of previous years, so far back as the year 1848, a fluctuating amount of deficiency would appear to be more or less permanent in the annual income of this country. For such a fact, which I attribute to a defective fiscal system whereby the natural expansion of national wealth is grievously cramped and hindered, the Legislative Bodies, which have so frequently assembled and separated without passing any of the laws which have repeatedly been submitted to their consideration by successive Administrations for the emancipation of trade, are, I think, more directly responsible than any particular Cabinet.

I have, &c.

(Signed)

RT. LYTON.

Frankfort.

Report by Mr. Corbett on the Mining Statistics of the Zollverein.

THE following general review of the mining and smelting industry within the limits of the Zollverein is an abstract of the last Returns which have been published relating to this subject; they come down to the end of the year 1863.

Especial attention is directed to the coal and iron Returns on account of the intimate connection which exists between these minerals as regards price, a cheap production of coal insuring a cheap smelting of iron ore, and as these two stand foremost in the list of the most important articles of industry and commerce, and conduce most largely to the comfort and well-being of the population in general.

MINES.

		Number of Mines.	Production.	Value.	Workmen.
	I. <i>Coal.</i>		Zoll.centners.*	Thalers.†	
1861	701	282,660,969	26,927,134	86,420
1862	688	311,525,560	27,699,298	88,206
1863	671	338,134,152	28,489,558	90,561
	II. <i>Anthracite.</i>				
1861	822	92,446,241	4,434,966	18,735
1862	833	101,687,984	4,703,363	19,648
1863	843	109,189,899	5,061,241	20,060
	III. <i>Iron Ore.</i>				
1861	2,458	36,165,400	2,980,029	21,434
1862	2,347	44,320,414	3,601,008	23,754
1863	2,018	47,494,909	3,915,992	23,540

A comparison of the above figures shows throughout a considerable increase both as regards production and value of the produce at the place of extraction.

* 0·9875 centner equal to 1 cwt.

† 1 thaler equal to 1s. 11d. English.

The increase of production as regards coal amounts to 55,473,183 centners; anthracite to 16,743,658 centners; and iron ore to 11,329,508 centners. In addition to the above-mentioned, the following quantities of minerals were produced in the year 1863, gold and silver ore 694,288·5 centners; quicksilver, 55; lead ore, 3,216,948; copper ore, 2,811,586; zinc ore, 5,833,864; tin ore, 4,273; cobalt, 35,775; arsenic ore, 39,290; antimony, 5,247; manganese ore, 864,847; vitriol ore, 792,263; graphite, 16,077; asphalt, 10,300; fusible spar (fluss spath), 105,543 centners.

In 1863 the whole number of mines in use amounted to 4,457. The number of workmen employed was 178,777; 509,089,314 centners of ore were extracted, which was valued at 46,462,395 thalers. In 1861 the number of mines was 4,975, giving employment to 167,538 workmen; 425,357,813 centners of ore were extracted, valued at 42,302,953 thalers. By a comparison of these two years, 1861 and 1863, it appears that in the latter there was a decrease of 518 in the number of mines, but an increase of 11,239 in the number of workmen employed, and of 837,781,501 centners in the quantity of ore extracted, and an increase in the value of the produce by 4,159,442 thalers.

FORGES AND SMELTING WORKS.

	Works.	Produce.	Value.	Workmen.
I. Wrought Iron.		Zoll. centners.	Thalers.	
1861	320	10,635,719	15,133,520	14,718
1862	303	12,682,410	16,533,382	14,688
1863	307	14,611,477	18,880,530	15,307
II. Wrought Iron for Steel.				
1861	6	213,700	443,404	118
1862	8	231,554	438,782	127
1863	6	447,969	817,525	136
III. Cast Iron made from Ore.				
1861	33	982,431	3,186,622	5,082
1862	52	1,012,131	3,208,100	5,644
1863	40	1,191,661	3,614,026	5,632
IV. Cast Iron made from Wrought Iron.				
1861	240	2,417,381	9,241,321	11,789
1862	288	2,638,574	9,785,019	13,982
1863	339	3,363,809	12,414,413	17,230

	Works.	Produce.	Value.	Workmen.
<i>V. Bar and rolled Iron.</i>		Zoll. centners.	Thalers.	
1861	481	7,094,896	24,735,293	23,227
1862	500	8,263,465	29,956,133	24,844
1863	489	8,715,185	29,120,681	25,227
<i>VI. Sheet Iron.</i>				
1861	25	865,094	4,496,493	2,736
1862	39	1,056,357	5,190,139	3,133
1863	34	1,224,621	5,620,523	2,784
<i>VII. Iron Wire.</i>				
1861	106	455,553	2,297,261	2,352
1862	105	560,084	2,641,029	2,428
1863	159	623,638	2,971,949	2,587
<i>VIII. Steel.</i>				
1861	167	665,177	5,492,112	4,838
1862	185	818,327	6,181,921	6,161
1863	177	1,085,009	7,733,613	9,482

As was the case with regard to the mines, we find also in the above Returns a generally satisfactory increase.

The smelting works within the Zollverein produced in the year 1863, besides: gold, 91·97 Zollverein lbs.* (in Saxony, 79·3 lbs.; in the districts common to Hanover and Brunswick, 12·1 lb.; in Prussia, 0·5 lb.); silver, 136,512·5 Zollverein lbs.; lead, 661,412 centners; litharge, 73,859 centners; sheet lead, 12,437 centners; refined copper, 62,622 centners; worked copper, 51,032 centners; brass, 38,878 centners; zinc plates and bars, 1,206,309 centners; zinc plates (thin), 266,385 centners; white of zinc ("zincweiss"), 39,332 centners; tin, 2,207 centners; mineral blue, 18,825 centners; nickel, 12,099 centners; arsenic, 11,801 centners; antimony, 1,570 centners; alum, 52,810 centners; vitriol, 91,209 centners; and sulphur, 7,052 centners. Whereas in the year 1861 the whole smelting business comprised 1,596 establishments, with 77,453 workmen, and a production of 25,729,331 centners, valued at 86,392,162 thalers; in 1863 the number of establishments had increased to 1,775, giving employment to 91,076 workmen, who manufactured 33,885,394 centners of metals of all kinds, valued at 105,521,946 thalers. There appears, therefore, an increase of 179 in the number of establishments, of 13,623 in the number of workmen, of 8,156,063 centners in the quantity of metals produced, and of 19,129,784 thalers in the value of goods.

* 10 Zollverein lbs. equal to 12 lbs. English.

Saltworks.—The produce of the saltworks in the year 1863 amounted to 8,601,102 centners, as against 6,818,842 centners in 1861. The first-mentioned amount consists of 2,712,509 centners of rock salt, 5,560,120 centners of kitchen salt, 183,982 centners of black and yellow salt, and 144,491 centners of salt for manures, of the aggregate value of 6,139,222 thalers. The number of works was 90, and of workmen employed 6,148.

WHOLE PRODUCTION OF MINES.

			Works.	Produce.	Value.	Number of Workmen.
				Zoll.centners.	Thalers.	
1861	6,669	456,435,507	134,007,084	250,985
1862	.	..	6,615	509,482,088	146,439,589	264,482
1863	6,322	551,575,810	156,575,527	276,001

These figures show what an extraordinary increase within the short space of three years has occurred in the production of the mines, forges, and salt works of the States forming the Zollverein. Although in that period of time the number of establishments has decreased by 347, the number of workmen has increased by 25,016, the production by 95,140,303 centners, and its value by 22,568,443 thalers.

Darmstadt, September 11, 1865.

(Signed)

EDWIN CORBETT.

Mexico.

Report by Mr. Middleton, Her Majesty's Secretary of Legation.

Mr. Middleton to Mr. Scarlett.

Sir, *Mexico, August 12, 1865.*

In compliance with the instructions contained in the Earl of Clarendon's despatch, marked Circular, of the 24th of February, 1857, I have the honour to transmit herewith my first half-yearly Report on the industry, trade, and general statistics of the Mexican Empire.

The almost entire absence of official documents in this country, the irregularity and frequent failure of postal communications, added to the disturbed state of many of those provinces even which have submitted to the Imperial rule, have rendered my endeavours to obtain statistical information fruitless, except with regard to mere isolated localities, whilst any attempt at a fusion of such information, so as to convey a clear and comprehensive idea of the national resources, has been frustrated from the same causes.

The tenor of an Imperial Decree of the 17th May last, however, re-organizing the Finance Department in all its branches, and especially enjoining the compilation of both a general Budget of the Empire, as also of a special one of the Finance Department itself, as one of the most indispensable duties of the person at the head of it, whilst it testifies to the neglect, hitherto, of so fundamental an obligation, would encourage the hope that, in my future Reports, I may be able more efficiently to fulfil the intentions of Her Majesty's Government.

I have, &c.

(Signed) R. T. C. MIDDLETON.

Report on the Industry, Trade, and General Statistics of the Mexican Empire.

THE Mexican Empire extends from the 15th to the 32nd parallel of north latitude, and from the 86th to the 117th degree of longitude west of Greenwich; its extreme length, north-west and south-east from the extremity of the State of Chiapas to the northern limit of Lower California, is upwards of 2,000 miles; its extreme breadth at 26 degrees of north latitude is over 1,100 miles; its coasts extend over 1,600 miles in the Gulf of Mexico and the Caribbean Sea, and upwards of 4,200 miles on the Pacific Ocean and in the Gulf of California; its northern and southern frontiers being respectively 1,792 and 532 miles in length, and it contains an area of about 834,140 square miles.

The cordillera of the Andes, after traversing South America, loses much of its elevation at Panama and again at Tehuantepec, and upon entering Mexico it branches off into two distinct chains, one running to the east and along the shores of the gulf, and the other to the west, along the shores of the Pacific, supporting between them a continuous lofty platform, declining, by the province of Oajaca, and rapidly on one side to the Western Coast, and descending, by a succession of terraces, on the other to the eastern by the provinces of Tabasco and Vera Cruz, this platform itself being intersected by numerous mountain chains, some of which rise to the height of 17,000 feet above the level of the sea.

Upon this elevated table land are situated the plains of Puebla, Mexico, Querétaro, and Michoacan, which are themselves at a height of 6,000 to 8,500 feet, a chain of volcanic cones and snowy peaks rising upon them at intervals.

This peculiar topographical formation of the Mexican Empire enables one easily to understand the causes of the great diversity of its climate, which depends less upon latitude than upon elevation, and to account for the classification of such parts of the country as have been brought into cultivation under the three following heads:—

The “*Tierras calientes*,” or “hot lands,” embracing those upon the two respective coasts, and extending up the slopes of the respective mountain-chains to an elevation of from 3,000 to 4,000 feet;

The “*Tierras templadas*,” or “temperate lands,” com-

prising the greater portion of the Empire situated at an elevation of from 4,000 to 8,000 feet, embracing the whole of the vast table-land between the mountains of the gulf and those of the Pacific slope, and comprising within their limits most of the greater centres of population.

The "Tierras frias," or "cold lands," which comprise the mountainous districts rising above the highest level of the "Tierras templadas" to the limits of eternal snow.

It may be observed, also, that the remarkable diversities of climate in Mexico, arising not so much from the great extension of latitude of the Empire as from a configuration of surface so calculated to produce such diversities within a narrow compass, scarcely admit of any very exact distinctions between the four seasons of spring, summer, autumn, and winter, being generally established; the Mexicans themselves very commonly dividing the twelve months into two great divisions, the "rainy season," which lasts from May to October, and the "dry season," which comprises the rest of the year. The rain begins on the East Coast about the first week in May, and, advancing with the trade wind, reaches the capital about three weeks later.

Few countries possess so great a variety or so great an abundance of vegetable productions as Mexico. The forests near the coast display the grandest specimens of tropical vegetation, such as mahogany, Brazil wood, palm-trees, and giant ferns, Campechy wood, iron wood, and American ebony; and, on the ascents, magnolias, carolinas, plumierias, and oleanders. At a height of 3,000 feet the Mexican oak predominates among the woods, intermingled with euphorbias and acacias, the oak disappearing at the height of 10,000 feet, while the pine flourishes between the elevation of 6,000 and 12,000 feet.

Dye-woods abound, especially in the Island of Carmen, on the coasts of the States of Vera Cruz and Tamaulipas, on the Atlantic, and on the coasts of the Pacific; logwood, particularly, being an important article of trade in Zalisco, the mountainous parts of which State produce an abundance of timber, such as ash, beech, elm, and oak, there being also large tracts of country covered with cedar trees and other woods, well adapted for cabinet-making purposes.

The best cultivated districts of Mexico are those which lie near the rich mines of the plains extending from Zelaya and Salamanca to Siláo, Guanaxuato, and Leon, the opening of a mine never failing to call tillage into existence.

It is probable that if the campaigns which have been undertaken against the unsubdued Indian tribes, who have striven to maintain their independence under all Governments since the time of the Spaniards, to whom alone they were favourably disposed, and who are continually carrying on hostilities in Yucatan, prove successful, that that extensive Mexican province may become one of the most prosperous in the Empire, although it be, as yet, one of the most thinly peopled; the population being, according to a census, made in the year 1862, only 248,156, thus composed:—

Whites—				
Men	39,437
Women	48,583
Indians—				
Men	76,442
Women	83,694
Total				248,156

Preparations for receiving foreign immigrants have, however, commenced on an extensive scale; a regular trade with England, also, by means of some sailing vessels which make the voyage between the port of Sisal and Liverpool every two or three months, has been established since last year.

The following is a Table showing the amount of exports from the port of Sisal, being the last Returns which have been compiled for the year 1864, and for the first six months of the year 1865, as well as a Return of the Custom-house duties levied at the same port during the year 1864.

This latter Return not having been published, but having been obtained from a private source, does not agree with the foregoing Return in regard to the period over which they severally extend, but may still serve to give an idea of by far the most important branch of revenue in this, as in all other Mexican provinces.

Value of exports from the port of Sisal in Yucatan from the 1st of January, 1863, to the 1st of January 1864:—

Note.—The amounts inserted in the preceding Returns are taken from the orders for embarkation presented by merchants at the Custom-house of the port in question, on making their exportations; but such orders for embarkation are commonly somewhat below the real value of the merchandize embarked, and never include the expense of packing, land freight, storage, commissions, and other expenses which nevertheless form a part of its value at the time of its exportation; and, therefore, in order to arrive at the proximate value of the goods shipped correctly, it is necessary to add from 10 to 15 per cent to the aforementioned orders; and thus, the average amount of the value of exports from the port of Sisal during the periods referred to, would appear to be as follows:—

Duty of 8 per cent. on exportation of logwood	545	16
Duty on exportation of gold and silver coined	201	48
Confiscations and fines	3,686	30
Total	324,547	90

Of the articles of food cultivated by the Mexican labourer, maize is the most important; and in some places the yield is immense, being sometimes at the rate of 250 bushels for every bushel planted; and in many parts of the country, two crops are gathered in annually, and even three off the same lands in some districts of the Gulf coast: and indeed, the yield is generally so abundant in some of the Inland States, such as that of Guadalajara, that the farmers dispose of it, in the more remote districts, from whence it would cost too much to send it to market, by fattening large droves of lean pigs upon it; and, when they can be made no fatter, boiling them down into soap with an admixture of a strong alkaline earth abounding in the country called Taquisquite, the soap so manufactured being worth about 10 cents per lb.

Maize, indeed, constitutes the staple article of subsistence, alike of man and beast, in all the central States of the Mexican Empire. The districts most distinguished for the culture of it are the southern and eastern parts of the State of Mexico, and the States of Puebla, Queretaro, and Oajaca, as well as the districts around Aguas Calientes, in Zacatecas.

"Frijoles," a species of black bean, are also an article of agricultural produce much consumed by all classes in Mexico.

Wheat and barley are also cultivated on the table-lands at the height of about 7,000 feet. The former often yields from 20 to 60 fold or more ; and the best quality is grown at Atlisco in the State of Puebla, and in the valleys between Queretaro and Guanajuato called the "Bajio."

The productions above referred to belong to the Mexican table-lands ; but the inhabitants of the "Tierras Calientes" principally subsist upon the banana and upon mandioca flour.

Vanilla also constitutes an important production, principally in the States of Vera Cruz and Oajaca ; as also capsicums, which are consumed in large quantities, especially amongst the lower classes of the population ; but amongst the cultivated plants of Mexico none is so generally met with as the "maguey" or aloe, the fermented juice of which, called "pulqué," is the favourite beverage of the country ; the fibres of the leaf serving for the same purposes as hemp.

The wine is cultivated with success in certain districts of the country, such as those around the town of Parras in the State of Coahuila, and in Tehuacan ; and the wine made is of good quality. The olive also flourishes in many districts, oil mills existing in the city of Mexico itself, as well as in the adjacent towns of Tacubaya and Toluca, and in the provincial capitals of Puebla and Guanajuato.

Little coffee is grown out of the State of Vera Cruz, except at Colima, where the trade is principally monopolized by a few German houses. In the districts of Orizaba and Cordova in the State of Vera Cruz, the crop does not usually reach more than 6,000 quintals, but is expected this year to reach 7,000 quintals. The cost of production is about 8 cents per lb. The coffee produced is usually sold on the spot at from 10 to 15 cents per lb. Some coffee is also grown at Jalapa and Cuernabaca, and a small quantity of very superior quality is grown at Villa Alta in the State of Oajaca.

Much tobacco is produced within the Mexican Empire, and, by an Imperial Decree of the 6th of April last, the rate of "alcabala" or gate dues upon such as is home grown was fixed as follows, with the exception of that denominated "macuche," the most inferior sort :—

Cents.			Cents.			
In leaf	..	per lb.	2	Cigarettes	per lb.	25
Snuff	..	"	19	Cigars	..	25

The tobacco denominated "macuche" to pay as follows :—

Cents.			Cents.			
In leaf	..	per lb.	2	Cigarettes	per lb.	4
Snuff	..	"	3	Cigars	..	4

By the same Decree the following rates of duties upon foreign tobacco imported into the Empire were fixed as follows :—

Cents.			Cents.			
In leaf	per lb.	25	Cigarettes ..	per lb.	75
For chewing	"	50	Cigars ..	"	50
Snuff	"	75			

Foreign tobacco upon its definitive passage through the Custom-houses of the interior of the Empire to pay as follows :—

			Cents.				Cents.
In leaf	per lb.	25	Cigarettes ..	per lb.	50	
For chewing	"	50	Cigars	100	
Snuff	"	50				

This Decree, by which the former rates of duties levied upon tobacco were nearly doubled, being now nearly 66 per cent. upon the prime cost to the grower, which averages about 3 dollars the "arroba," has caused much dissatisfaction; and as the framing of it became known some months previous to its actual publication, great efforts were made to push on the crops, so as to introduce large quantities into the chief centres of consumption previous to the promulgation of the Decree, the effect of which has been to put a stop to all wholesale trade in tobacco, all the stock in the grower's hands having been at once disposed of, as also to cause a rise in price in the city of Mexico of about 6 cents per lb., which necessarily goes into the pocket of the wholesale dealer without any advantage to the Imperial Government; nor is it very improbable, owing to the great increase in smuggling to which this augmentation of duties will give rise, as well as from the time which must elapse before the new law can take effect, owing to the large stock of tobacco on hand, that the Government may find it expedient to introduce some modifications into the terms of the Decree in a liberal sense, and in accordance with the pressure of public opinion.

Cotton is grown in considerable quantities on both the

Atlantic and Pacific Coasts of the Mexican Empire, and also in the Northern States of the Interior, Durango and Coahuila, the cotton produced in the districts bordering upon the River Nazas, in the first-mentioned State, generally selling at a rather higher price than that produced in Texas, which is of inferior quality.

But little of the cotton grown on the West Coast of the country is brought to the city of Mexico itself or its neighbourhood ; that produced in Guerrero and Michoacan being chiefly consumed in a factory established at Colima, a town which contains a number of German commercial houses, and which, from its convenient proximity to the port of Manzanillo on the Pacific, has become a place of considerable trade, whilst the cotton produced in the province of Jalisco forms part of the supply required for the spinneries of Guadalajara and Tepic.

From the northern provinces of Durango and Coahuila considerable quantities of cotton are brought for sale to the city of Mexico. but the great bulk is conveyed thither over-land from Texas.

On the east coast of the Empire the cultivation of cotton is almost entirely confined to the State of Vera Cruz, where its production has of late been increasing rapidly, owing to the inducement which has existed to ship it to New York and Liverpool. At some of the ports of the Gulf, such as Tampico and Matamoros, cotton was, during the war in the United States, also received from Galveston and other ports of Texas by steam-vessels which broke the blockade, but the greater part of the cotton so received was re-shipped for Europe, a small portion only being conveyed into the interior of the Mexican Empire.

In ordinary times, nearly the whole of the cotton produced in the State of Vera Cruz was sent up to Puebla and Mexico for the supply of the spinneries in those districts, but during the war in the United States nearly the whole of it has been exported.

Considerable consternation was caused amongst the cotton manufacturers of Mexico by two Imperial Decrees of the 8th of May last, by which an *ad valorem* duty of 6 per cent. was imposed on every description of woven stuffs manufactured in Mexico from cotton, flax, and wool.

The cotton spinneries in Mexico consume per annum, as nearly as can be ascertained, about 14,400,000 lbs. of cotton wool, which is mostly made into heavy brown shirting, and also sheeting, denominated "mantas," weigh-

ing from 5 to 10 lbs. per piece of 30 yards, the remainder being sold in yarn Nos. 12 to 24, which is dyed and then woven into "rebosos" (a kind of scarf of almost universal usage among the female part of the lower classes), and other sorts of goods peculiar to the wants of the peasantry.

The present annual value of the cotton manufactures of the country amounts to between 10,000,000 and 12,000,000 dollars, an approximate calculation amounting to 10,868,000 dollars, which would give 622,086 dollars as the amount of the tax to be levied; but it is probable that it will not exceed 500,000 dollars, as a considerable portion of the goods which are legally subject to it will reach the consumer without paying any duty at all, on account of smuggling and false Returns.

The imposition of the tax in question will naturally have a direct tendency greatly to increase the importation of cotton goods into the ports of the Empire, both directly by the increase in the sale of the same description of them as are manufactured in the country, and indirectly by increasing the sale of the finer descriptions of printed and bleached Manchester goods, a result to be anticipated from the increase in the price of the commoner sorts.

As was before stated, the best cotton grown in Mexico is that produced in the State of Durango, and it is equal, if not superior, to that known in the Liverpool market as "Middling Orleans," and while the recent high prices were current in England and the United States, some of the Durango cotton was exported by way of Monterey and Matamoros, notwithstanding the very heavy charge for land carriage that was thus entailed; but as a general rule the Durango cotton is consumed exclusively within the Mexican Empire, supplying, in the first place, the spinneries in Durango itself, and then those at Parras in Coahuila, the surplus being brought on to Queretaro and the city of Mexico, where a higher price is paid for good Durango cotton than for that produced in Texas.

In the aggregate, however, there is not sufficient cotton produced in the Mexican Empire to meet the demand; and previously to the war in the United States, a large quantity was imported into the country from New Orleans by way of Vera Cruz. Since the supply from New Orleans has ceased, however, the deficiency has been made up by the introduction of it from Texas, whence it comes in large quantities to Guadalajara and Puebla, by way of Monterey and San Luis Potosi; from the great increase in the culti-

vation of cotton, however, in so many parts of the country, and now that the inducement to export it to Liverpool will cease, it might be said that the supply of the article produced within the Empire would be sufficient for the absolute requirements of the population.

In the south-eastern part of the province of Vera Cruz, the produce of cotton ranges from 170 lbs. to 566 lbs. per acre, the average crop being about 300 lbs. per acre. From 500 to 600 arrobas (the arroba being 25 lbs.) in the seed is considered a fair amount for the fanega of ground to produce (the fanega in the province of Vera Cruz containing about 15 acres). The cotton yields, after the process of "ginning," an average of 84 per cent. of clean material, some of very superior quality yielding as much as 38 per cent; none, however, yields less than 38 per cent.

The trade is mostly in the hands of Spanish shopkeepers established in the towns and villages of the cotton-growing districts. These people were formerly in the habit of making advances, principally in goods, on the crops whilst still standing, at the rate of 6 reals (about 8s.) per arroba of cotton in the seed, with the proviso, after being repaid their advances, of taking the balance of the crop at the current rates of prices at harvest time; but as it is difficult to collect debts, and most particularly so to enforce contracts on the coast, the small cotton-grower who had received advances on his cotton from the shopkeeper very commonly sold the greater part of his crop by stealth to other parties, and then complained of the deficiency of it. The balance of his debt, therefore, had to be carried over to the ensuing year, and the usual result was that those persons who carried on the business of advancing money on cotton usually had a large balance of bad debts on their books, and which absorbed the profits they calculated upon; and this state of things it was which induced most of the Spanish shopkeepers and persons who had been accustomed to advance money on cotton of late years to commence growing cotton on their own account, principally on the Cocuite estate, near Thaliscayan, where there are now about 4,500 acres under cultivation by them this season:

Two large "ginning" establishments were erected by these persons last year in addition to the large steam "ginning" establishment erected by an Englishman, Mr. Grandison, some years ago; but they were burnt down

by the French troops during the warfare which was carried on in that part of the country at the beginning of the present year, the standing crops having escaped the same fate from having been too green at the time to take fire.

An English firm commenced growing cotton on an estate about fifty miles to the south of Orizaba, in the State of Vera Cruz. The results were unfavourable last year, owing to the seed having been sown too late in the season; the drought also, which began early, and was unusually protracted, prevented the crop from forming, and most of the balls dropped off.

This English firm have this year about 450 acres of cotton under cultivation, but the estate consists of above 100,000 acres of good cotton lands. There is great difficulty in procuring hands to cultivate cotton, as the population of the coast is very scanty, and is mostly engaged in the breeding of cattle. The Indians may be brought down from the table land, a distance of at least 80 leagues, but are too apprehensive of the pernicious effects of the climate to consent to remain more than two or three months at a time, at the expiration of which they have to be replaced by others, and the advances in money which have to be made to them to induce them to come at all are seldom or ever reimbursed. The wages paid at present are 4 reals (about 2s.) per day, and in some places rations of corn, beans, and lard are given besides, which amounts to 1 real (about 6d.) per day more, if the planter produces these articles of food himself, or to 2 reals (about 1s.) if he has to buy them. The railway at present in process of construction from Vera Cruz to the city of Mexico has likewise increased the difficulty of procuring Indian labourers, as they can earn a dollar to 10 reals (about 5s.) on the works along the coast; but this difficulty will not extend over another year, as that part of the line which traverses the Tierra Caliente is approaching completion, and no difficulty exists in procuring labourers for the works on the table land and out of the range of yellow fever at much lower wages.

The cotton crops for the last two years have suffered much from the attacks of caterpillars, which are of periodical occurrence, from ten to fifteen years transpiring between them; the last appearance in any considerable numbers of these insects having been in 1850 and two succeeding years.

The crop of cotton in the State of Vera Cruz last year

amounted to about 30,000 quintals, of which about 12,000 were exported to Great Britain, the United States, and France, the quality of the article being considered to be equal to good middling New Orleans. Some consignments sent to Liverpool fetched 2s. 5d. per lb.

The crop of cotton in the State of Vera Cruz of the present year, just gathered in, is estimated at about 52,000 quintals, thus divided amongst the following different districts :—

	Quintals.
Tlacotalpan, on the Papaloapan River	15,000
Thaliscoyan, on the Blanco River	13,500
Cosamalapan and Chacaltiangues	8,000
Paso Jaly, on the Tonto River	7,500
Tustepec, on the Tonto River	2,500
Amapa and Peña Grande.. ..	5,500
	<hr/>
	52,000

However, this estimate may be considered as a low one, several small districts which yield a fair amount of cotton in the aggregate not being included therein.

According to some estimates the cotton crop of the present year will reach as high as 80,000 quintals.

The outlet for all the cotton in the above-named districts, by water carriage, is to the port of Alvarado, from whence the cargoes are usually shipped for Vera Cruz.

The best sugar in Mexico is produced in the States of Orizaba and Jalapa; but the greatest sugar-growing districts are those of Cuernabaca and Cuantla.

As yet, only a small quantity of extra refined sugar is imported into the country, the quantity produced being nearly equal to the demand; but, from the proximity of a large extent of land well calculated for the cultivation of the cane in the Cordova district to the line of railway from the city of Mexico to Vera Cruz, it is probable that a great impulse may shortly be given to its cultivation: and a few years ago, sugar usually sold for about 3 reals (about 1s. 6d.) per arroba in Cordova; but on account of the rise in the price of labour which has taken place within the last two years, it could not now be sold at so low a rate, at least to yield a reasonable profit. From the increased facilities of transit which the railway will afford, it is generally anticipated that sugar will become an important article of export from the State of Vera Cruz, and from other parts of the country, as it was during the Spanish

occupation ; the average annual produce of it manufactured within the Mexican Empire having been roughly calculated to be about 75,000,000 lbs. ; 40,000,000 lbs. of which are thus manufactured :—

In the State of Mexico	25,000,000
" " Puebla..	4,000,000
" " Vera Cruz	2,500,000
" " Michoacan	5,000,000
" " Tabasco	2,000,000
" " Oajaca	1,500,000
Total	40,000,000

Indigo was formerly an article of considerable export from the State of Vera Cruz, but has now ceased to be much cultivated. It is to be found growing wild in large quantities in many parts of Oajaca, Tabasco, Yucatan, Chiapas, Michoacan, and Calima ; that found in the last named State being considered to be of superior quality.

Cochineal is largely exported from the Mexican Empire, which may indeed be said to enjoy almost a complete monopoly of the trade ; according to an official report, the production of this article in the State of Oajaca alone has amounted annually, for more than a century past, to over 1,000,000 lbs., representing a value of about 990,000 dollars.

Rice is cultivated to a considerable extent in the "Tierras Calientes," and yields from 40 to 60 per cent.

Cocoa of a fine quality is produced in the State of Tabasco, and at Saconusco in the State of Chiapas, and at some other places in the proximity of the Atlantic Ocean.

To the great variety and riches of the vegetable world in Mexico, must also be added the extraordinary mineral wealth.

Besides the gold and silver mines of such "world wide" renown, there are rich and abundant mines of iron, copper, mercury, tin, lead, zinc, cobalt, sulphur, salt, and porcelain clay. The ruby, amethyst, topaz, opal, garnet, and agate, are likewise found : and marble and various kinds of stone for building exist in abundance.

Deposits of petroleum have been "denounced" in the Provinces of Oajaca, Tamaulipas, and some others ; but doubts exist as to the genuine character of the bitumen discovered in them.

Information as to the present state of agriculture and manufactures in the different Provinces of the Empire, and of the amount of duties of export and import levied in the

different provincial Custom-houses, is only obtainable from such of the provinces as have been reduced to subjection for a sufficiently long period to admit of a tolerably regular administration of their internal affairs being established; the action of the newly appointed Imperial authorities in many of them being paralyzed by the constant re-appearance of the different Republican Chiefs and their followers, and banditti who come to extort supplies in money or produce, as well as by the absence of any kind of municipal records or data upon which to base their administrative proceedings, and the disinclination of those with whom they are brought into contact to co-operate with them or offer them any support.

The information which I am able to supply respecting the statistics of the Mexican Empire, in so early a stage of its existence, must, therefore, necessarily be but scanty and defective, although derived entirely from persons residing in such of the provinces as have been so far reduced to subjection as to admit of an opinion being formed as to their present more or less preponderance or ultimate capabilities.

The following is a list of the periods at which any regular local administration has been established at all in the undermentioned towns of the Mexican Empire; taken from the dates of the first financial documents received from thence at the Ministry of Finance:—

Toluca ..	July	1863	Guadalajara ..	Jan.	1864
Cuernavaca ..	July	1863	Morelia ..	Jan.	1864
Pachuca ..	July	1863	Zacatecas ..	Feb.	1864
Tlaxcala ..	July	1863	Tuxpan ..	May	1864
Morelos ..	August	1863	Aguascalientes ..	Feb.	1864
Tulaucingo ..	August	1863	Durango ..	July	1864
Tampico ..	August	1868	Mazatlan ..	Nov.	1864
Tula ..	Nov.	1863	Colima ..	Nov.	1864
Querétaro ..	Nov.	1863	San Luis Potosí ..	Dec.	1863
Guanajuato ..	Dec.	1863	Oajaca ..	March	1865

Trade has been long in a languishing condition, and is, at the present moment, almost entirely paralyzed in the important northern State of the Empire, San Luis Potosí, owing, amongst various other causes, to the feeling of insecurity which prevails (especially in such small towns as are not under the immediate protection of the Imperial troops) to the neglected state of the mines, and to the small amount of money put into circulation by the Government, as the troops draw their supplies from other quarters. The crops are of an average description: maize, which is the principal article of food of the poorer

classes, being about 3 dollars the fanega; whilst during a part of last year it was as high as 9 dollars: the price in normal times having usually averaged from about $1\frac{1}{2}$ to 2 dollars the fanega.

No returns could be obtained of the amount of export and import duties levied in the Custom-houses of the district, as no statistical documents respecting them exist, having either never been compiled or else destroyed; and such scanty details as could be obtained of the amount of agricultural produce, such as maize and "frijoles" (beans), which enter the city from the adjacent towns would be of no interest, as it would convey no accurate idea of the commercial movement prevailing in the province in general.

In the adjoining State to San Luis Potosi of Zacatecas, the export and import Returns of the Custom-house for the last year of 1864, and for the first quarter of the present year, was as follows:—

From October 1 to December 31, 1864 :				From January 1 to March 30, 1865 :			
		Dols.	c.			Dols.	c.
Imports	..	88,070	6	Imports	..	106,622	0
Exports	..	6,521	2				
				Total Returns, six months	..	201,213	8

Of exports, there are hardly any articles which are subject to duty on leaving the Province of Zacatecas, and it is only when a convoy of specie is sent out that international duty is levied and leaves a return worth noting; commercially speaking, the district may be designated as an exclusively mineral one, the trade and agriculture in it mainly depending upon the results given by the working of the silver and copper mines.

The annual coinage of the Mint in the city of Zacatecas amounts to rather more than 4,000,000 dollars.

The districts of the province under tillage produced in average years about 600,000 fanegas of maize, which is their chief production, and most of it is consumed within the province, some portion occasionally finding its way northwards; but the greater part of the lands of Zacatecas being hilly and barren, sheep and goats are found to thrive upon them, and are bred in considerable numbers; the woollen factories of Mexico, Queretaro, and Celaya being principally supplied from thence.

Goat skins are also annually exported to a considerable extent to the United States; and the important mineral districts of Real del Monte and Guanajuato are indebted for the greater part of the tallow and salt they consume to remissions from Zacatecas.

The amount of exports and imports during the last quarter of 1864 and the first quarter of the present year, from Guanajuato, capital of the State of the same name, is embodied in the following Returns from the Custom-house of that city, under the following distinct heads:—

1. Imports of Country Produce into the City of Guanajuato ;
2. Imports of Foreign Goods into the State of Guanajuato ;
3. Exports from the State of Guanajuato.

IMPORTS into the City of Guanajuato.

NOTE.—The Value of these Imports cannot be given, as it is not noted in the Customs Returns.

EXPORTS from the City of Guanaxuato.

Articles.	Quarter ending December 31, 1864.		Quarter ending March 31, 1865.	
	Packages.	Value. Dollars.	Packages.	Value. Dollars.
Country produce ..	2,319	46,092	1,422	26,617
Foreign produce ..	2,300	28,860	1,066	26,576
Total	74,952	..	53,193

NOTE.—The value of these Exports is considerably understated.

It will be seen from the foregoing Returns that a considerable increase in the commercial movement of the city of Guanaxuato has taken place during the last six months, and that the importation of foreign goods into it has nearly doubled; it may also be observed that various valuable articles are omitted in the first Return, owing to no duties having been legally leviable upon them at the time it was compiled; added to which much contraband trade exists. The Returns also relate to the city of Guanaxuato alone, as it is impossible to procure similar ones from the other principal towns of the State, from which, however, there is reason to suppose that an approximate or equal amount to that shown in the Returns from the city of Guanaxuato itself might be calculated upon; as the State, besides the capital with an estimated population of 60,000, contains some large towns, such as Leon with a population computed at about 120,000; Celaya with 25,000; and San Miguel with 15,000, and other smaller ones.

During the first six months of the present year, the following is a list of the money coined at the Mint of the city of Guanaxuato;—

Gold ounces	218,000	Quarter-dollar pieces .	13,500
Dollars	1,697,000	25-cent. pieces ..	12,000
Half-dollar pieces ..	16,500		
50-cent. pieces ..	9,500	Total pieces ..	1,966,500

The value of the total amount coined being 3,024,125 dollars.

The industry of the State consists of mining, manufactures, and agriculture.

The first branch of industry, owing to disturbances and some other local causes, is, at present, in a depressed condition.

The manufactures consist of a cloth manufactory at Celaya, worked by foreign capital, tanneries at San Miguel and Leon, saddlery and coarse woollen stuffs at Leon, as well as shoes and "rebosos" (cotton scarfs) at the latter place; but no statistics exist of the value of these productions.

The agricultural produce consists of maize, wheat, "garbanzos" (large peas), "frijoles" (beans), and capsi-cums; no cotton or tobacco having yet been cultivated. On most of the farms flour-mills exist, or are in course of erection; but the ordinary implements used in tillage are of the most primitive and imperfect construction.

The undermentioned is a statement of the Returns of the Custom-house of the port of Mazatlan in Sinaloa, and the coast of that State, during the last quarter of 1864 and the first quarter of the present year; but it must be borne in mind that it is impossible to ascertain the exact amount of specie shipped from the coast, part of the State having only lately been wrested from the hands of the Republican Faction. The amount has lately been less than usual, owing to the British merchants having been in the habit of buying French commissary drafts, from the rate of exchange being favourable and shipment on the coast uncertain.

The same difficulty exists with regard to the exact amount of imports, the greater part of the goods referred to paying by measurement, and not by value, which is not even declared at the Mazatlan Custom-house; the total amount named may be, however, relied on as nearly correct, representing the home cost of the goods with shipping charges.

Neither in the statement of Export Returns are the sums remitted in French commissary notes, amounting to at least 200,000 dollars, inserted as an item; and, owing

to the ports of Altata and Navachiste, in the State of Sinaloa, still being held by the Republican Faction, it is impossible to state exactly the total value of the funds exported from thence; but the amounts given are rather under than over what have been shipped.

Her Majesty's ship "Alert," lately embarked 186,000 dollars at the port of Altata, the money having reached the coast from Culiacan in the interior, before that city was taken possession of by the Republican Faction.

Exports from Mazatlan and the Coast of Sinaloa for the last Quarter of 1864 and first Quarter of 1865.

Imports into Mazatlan and to the Coast of Sinaloa for the last Quarter of 1864 and the first Quarter of 1865.

Last Quarter, 1864—	Dollars.
Five vessels from Europe with cargoes valued at	1,750,000
From San Francisco	75,000
First Quarter, 1865—	
Two vessels from Europe with cargoes valued at	380,000
From San Francisco	75,000
Total	2,280,000

Note.—It may also be observed that about three-fourths of the cargoes from Europe are British goods.

The Import and Export Returns from the Custom-house of the port of Tampico, in the State of Tamaulipas, for the last quarter of 1864 and for the first quarter of the present year are as follows :—

From 1st October to 31st December, 1864—	Dollars.
Imports	1,348,500
Exports	270,543
From 1st January to 30th March, 1865—	
Imports	1,659,900
Exports	2,032,127
Total	5,311,070

My efforts to procure the Import and Export Returns from the Custom-house of the port of Vera Cruz for the last quarter of 1864 have been unsuccessful; but for the first quarter of the present year, I find them thus officially stated in the French "Moniteur" of the 2nd May last—

1865—					Dollars.	c.
January	455,215	50
February	407,283	84
March	392,375	22
Total					1,254,874	56

According to the same authority, the Returns of the Custom-house of Vera Cruz for the first quarter of 1864 only amounted to 395,600 dollars 44 cents, the amount thus showing an increase during the same period of this year of 859,274 dollars 12 cents.

The same French official journal also states that an analogous increase in the Customs Returns of the other Mexican ports has taken place since the cities of Mazatlan, San Blas, Manzanillo, and Matamoros have acknowledged the Government of the Emperor Maximilian, and since the pacification of the State of Jalisco has reopened the communications between the State of Guadalajara and the towns situated on the Pacific.

From the remote and, as yet, unsubdued State of Chihuahua, and from that of Durango, I have been unable to obtain the slightest information, either as to the condition of its trade or agriculture; and the disturbed condition of the State of Sonora, on the Pacific, has alike rendered it impossible to obtain any commercial reports or any other statistical information from thence. My efforts to procure a statement of the Customs Returns from the important port of Matamoros in the north of the Province of Tamaulipas, have been attended with a like unsuccessful result, indeed no returns have been made from thence for the last three years, owing to the confusion prevailing in the public accounts from constant changes at the Custom-house, and the lax way in which affairs have been conducted. The commerce of the port of Tampico has, as yet, greatly suffered from the present position of political affairs, the blockade having in the first instance diverted its trade to Vera Cruz, and all communications with the interior having been subsequently interrupted, and, indeed, for a time completely cut off, then reopened, and then after repeated interruptions, having been again closed.

Agriculture is a branch of industry to which little attention is paid in that part of the Empire occupied by the State of Tamaulipas, notwithstanding that the soil and climate are, as in the neighbouring State of Vera Cruz, admirably well adapted for the cultivation of cotton, sugar, rice, and all cereals peculiar to tropical countries; but, owing to scarcity of hands for field labour and want of enterprise, nothing beyond what is absolutely necessary for their individual consumption is grown by the land-owners, who confine themselves to the breeding of cattle, and that only to a very limited extent.

No statistical Returns of any description can be obtained from the State of Guerrero, as it has remained under the Empire, as under the Republic, together with its port of Acapulco (the latter much frequented by vessels engaged in the Pacific trade) entirely independent, nor have the French extended their military operations in that direction.

It is impossible to obtain any very accurate information as to the amount of the population of the Mexican Empire; but from some data obtained in 1857 with a view of forming a census, it was, then, conjectured to be about 8,000,000, which nearly tallies with the amount of population, namely, 8,218,080, consigned in the official document which was framed in connection with the new division of the Empire, made for military purposes, and which is subjoined as Annex No. 1.

It will thus be seen that the population of the Mexican Empire is so small, being only at the rate of about nine persons per square mile, as to render immigration upon a large scale and extensive foreign colonization absolutely necessary for the development of the great natural resources created by the geographical position of the country, its diversity of climate, and the fertility of its soil.

This subject has occupied the attention of the Mexican Government for some time past, and formed the subject of Imperial Decrees of the 29th March and of the 15th May last, by the latter of which a credit to the amount of 10,000 dollars is placed at the disposal of the Minister of Public Works to be applied to the temporary relief of such immigrants as may arrive in an indigent condition.

By another Imperial Decree, under date of the 19th of the present month, a credit of 21,000 dollars is opened for the realization of a contract entered into between the Minister of Public Works and *Lieutenant de Tourville* for

the establishment of a colony amongst the mountains of Zongolica, in the State of Vera Cruz, to be composed of soldiers who have completed their term of service in the Foreign Legion of the Empire.

According to the terms of the contract the colony is to consist, at first, of 200 colonists, and the ground necessary for their establishment is to be allotted by the Government upon the basis of 100 acres per head, and at the rate of 1 or 1½ dollars per acre, according to the quality. The Government also engages to make over to M. de Tourville the sum of 11,700 dollars for the purchase of cattle, seed, and tools; 6,000 dollars to be paid upon taking possession, and 5,700 dollars upon approval of the mode of disposal of the first amount, the whole sum to be reimbursed in five yearly payments equally by all the colonists, who are to assist equally in all indispensable preparatory labour. At the expiration of the five years, and the liquidation being effected, each of the colonists will have acquired a right to his proper share of the cattle, tools, and everything belonging to the colony in general.

The Government is, besides, to furnish the necessary land for the construction of houses, one allotment of 800 acres to be ceded to M. de Tourville himself, as a recompense for his preparatory labours: M. de Tourville also to have the attributions of arbitrator conferred upon him for the adjustment of all matters of dissension amongst the colonists, and the Minister of Public Works to invite the Commander-in-chief of the army to furnish the colonists with such arms and ammunition as may be necessary for their defence.

For colonization purposes, the provincial authorities have been directed to furnish Reports upon the nature of the soil and the natural capabilities of the districts under their supervision; some privileges, such as the free introduction of tools, agricultural implements, cattle, &c., into the different ports, having been accorded by an Imperial Decree of the 2nd May, to a North American Emigration Society, represented by Mr. Caulfield, whilst a permanent Emigration Committee, to consist of four Mexicans and eight foreigners, was appointed to sit in the capital by an Imperial Decree of the 1st May last, three of the eleven members of which it is composed being Englishmen.

The objects sought after by this Committee might be much advanced if the different Emigration Societies of Europe were to put themselves into communication with it.

A Special Commissioner, M. Emile Longuemare, has also been appointed by the Minister of Public Works to concert with the authorities of Cordova and Orizaba respecting the preliminary measures to be adopted for colonizing those provinces which, from their proximity to the port of Vera Cruz, are the most favourably situated for the purpose. M. Longuemare has lately put forth an announcement to the effect that the Government are prepared to treat for the sale of the public lands of Zongolica, Piedras Negras, Ojo de Agua Grande y Chico, Cacahuatl, San José en Medio, and Achoapan, the last situated in the district of Cordova.

These lands are calculated for the cultivation of coffee, sugar, tobacco, rice, and maize. The price varies from 1 to 1½ dollars per acre, according to the situation, and to be payable in five years. The concessions to the colonists are not to exceed from 320 to 360 acres, according to whether the colonists be heads of families or not, the lands to remain mortgaged to the Government until the purchase money be made up.

Mr. Caulfield, who returned to the United States so soon as the Royal Decree was published, is provided with a statement, signed by the Minister of Public Works, of the resources which the Mexican Empire affords to colonists, and which, as coming from an official source, I think it expedient to subjoin.

"Purchase of Land.—Land can be obtained in all climates, and, consequently, every species of produce can be cultivated.

"Upon the coast, and generally in the hot region ('tierra caliente') to the south of Mexico and of Morelia cotton, coffee, rice, sugar cane, tobacco, &c., are cultivated.

"The elevated Departments of the Empire, such as Guanajuato, San Luis, and Zacatecas produce every kind of corn, the grape, the olive, and flax, and every species of cattle can be reared therein.

"In Morelia and Oajaca the most successful results might be obtained from the breeding of silkworms, since the China mulberry tree flourishes admirably, and the silkworms are of the finest description, whilst the natives, being accustomed to the rearing of the cochinille, would be able to attend to them properly.

"Industry.—Industry possesses a wide field for its exercise in Mexico: no other but large cotton and woollen

manufactories exist as yet ; all others, therefore, remain to be established, and flax manufactories would be most productive speculations, from the number of running streams which might be turned to account as motive power, and on the banks of which flax grows luxuriantly.

“ *Mines.*—According to our laws foreigners can hold mines by the same tenure as Mexicans, whether by first denouncing their discovery, whether by assuming the proprietorship, that is to say, by furnishing capital for the working of the same to the owners thereof. In this respect Nature has been so bountiful to Mexico that occupation will not be wanting either for capital or for the foreigners who may arrive.

“ To the south of Morelia and in the district of Coalcoman there are most prolific iron and copper mines, and of natural bronze, which comes straight out of the mine with only the usual amount of alloy possessed by zinc.

“ In the neighbourhood of Oajaca, and near two woods and rivers of some extent, there are gold, silver, and iron mines, and provisions are so cheap that their small value may account for the indolence of the natives, who have few wants.

“ With respect to the rich silver deposits of Guanajuato, Zacatecas, Catorce, Tasco, and many others, one may affirm that they are but imperfectly known, and that they contain an immense amount of riches, destined to come to light when they shall be explored. A large number of mines are already being profitably worked, and, not long ago, one of those of Guanajuato gave one of the greatest yields ever known in the whole world.

“ In the environs of Jalapa there are deposits of gold, iron, and coal, as well as of copper, in fabulous quantities.

“ Coal is found near to Tuxpan, Tlaxcala, to the south of Morelia and of Matamoros ; and in general all the mountains abound in mineral productions, which have never been extracted, owing to our civil wars and want of population.

“ There are opal mines at Zimapan, and, towards Atargia and Iturbide, mercury, marble, salt, sulphur, saltpetre, &c., which productions exist in a great many different places.

“ *Public Works.*—Up to the present time only one line of railway is in course of construction, that from Vera Cruz to Mexico” (that from Mexico to Chalco has been over-

looked by the Minister in this statement), "but another has been conceded as far as the Pacific, which is to follow the direction of the great valley through which the Lerma flows, that is to say, by Toluca and Departments of Mexico, Morelia, Guanajuato, and Jalisco, terminating at San Blas, but the branch lines connected with the main one have yet to be conceded, and the Government is quite disposed to concede lines of railway to private Companies, such as, for example—

"1. From the River Acambaro to Guanajuato and Querétaro.

"2. From Guanajuato to Guadalajara by Leon and Lagos.

"3. From Querétaro to Matamoros by San Luis Potosi and Saltillo.

"4. From Lagos to Zacatecas and Durango by Aguascalientes.

"5. From the port of Mazatlan to Durango and Chihuahua.

"The first four of these lines pass through a country which must ensure a great traffic, and which presents no obstacles to their construction, and there are other parts of the Empire in which railways would prove lucrative speculations to the Companies which might undertake to make them.

"We also possess many rivers which might be rendered navigable, such as the Panuco, which empties itself into the sea at Tampico, the Zacatula, or, as it is sometimes called, Las Balsas, which empties itself into the Pacific, and by which boats might descend almost the whole way from Puebla; the River of Santiago, from San Blas, through the Departments of Jalisco and Morelia, the Goatzacoalcos to the middle of the Isthmus of Tehuantepec, and other rivers of minor importance."

The efforts of the Mexican Government to attract immigrants to the shores of the Empire have met with some results which, however trifling, may encourage the hope that, when public tranquillity is permanently established, the number may greatly increase. The following are the Official Returns of the number of immigrants and persons seeking employment who have arrived in Mexico during the months of April, May, and June last, with the names of the ports of their disembarkation:—

It will be seen by the above Returns that the number of immigrants who have been induced to seek to establish themselves in Mexico is but insignificant at present. It is reasonable to suppose, however, that a wider extension to colonization may shortly result from the efforts of the Government to promote it, and in view of the success obtained by an Italian colony called "Villa Luisa de los Italianos," established near Tuxpan, at a village called Tecotlutla, near the coast of the State of Vera Cruz, which, although founded under the Government of President Comonfort, appears to be in process of development under that of the Empire, and to be destined to attain great prosperity.

In the year 1857 General Luigi Masi entered into a contract with the Chevalier Musso, Mexican Consul-General at Genoa, charged with the formation of an Italian agricultural colony in Mexico, by President Comonfort, stipulating for the departure of 200 immigrants, mostly natives of the coast between Genoa and Nice, with or without families, as a preparatory expedition, and the expense of their voyage to be defrayed by the Mexican Government. Upon the arrival of these individuals, whose number amounted to 227, they were despatched to the locality which had been selected for their dwelling-place, called the Barra de Tuxpan, but which proved so insalubrious that some died and others became incapacitated for work, so that it was found necessary to apply to the Government for a more healthy locality; the colonists being removed, in the mean time, to a place called Papantla, also in the State of Vera Cruz, the salubrity of which speedily restored them to health. In the meanwhile the second expedition of colonists arrived from Italy, and, in accordance with the desire of those who had arrived first, lands situated upon the River Tecotlutla, and the site of the present colony, and within a short distance of the sea shore, were bestowed upon them, and upon which the colonists, consisting, since the second expedition had arrived, of 340 persons, commenced building houses and marking out allotments. Illness, ending fatally in many cases, speedily showed itself again amongst them, however,

but diminished in proportion as the ground was cleared and the marshes were drained, and at length the industry of the colonists obtained most satisfactory returns from lands so intrinsically fertile, and which had never before been brought into cultivation.

Upon General Masi preparing a third expedition of colonists he was opposed by the authorities of Vera Cruz, on account of revolutionary movements and the civil war, but, when peace was restored and the Empire proclaimed, the Director of the colony, M. Pietro Scapini, was sent for to Europe by the General, for a conference, resulting in the reconstructing of the colony upon a firmer basis.

The capital already subscribed for the furtherance of the objects of the Society already amounts to 3,000,000 francs, and so soon as the Imperial Government shall have consented to certain new stipulations, already agreed to, being carried into effect, 10,800 more colonists, already registered, will start in Italian vessels for the port of Vera Cruz.

The crops the most successfully cultivated in this Italian colony consist of cotton, coffee, cochineal, and vanilla, and different choice woods are also cultivated to a large extent.

The transfer to the Imperial Mexican Company in London of the railway from the city of Mexico to the port of Vera Cruz, by Mr. Antonio Escandon, to whom the privilege of constructing it had been conceded, under the Republic, by Decrees of the 31st August, 1857, and 5th April, 1861, was confirmed by an Imperial Decree of the 26th January last, copy of which is subjoined, as Annex No. 2; several clauses in the original grant which were detrimental to the interests of the State having been suppressed.

The line is to pass through the important towns of Cordova and Orizaba, and will, according to the preliminary surveys, be 428·07 kilomètres in length; the branch line to the town of Puebla being, according to the preliminary surveys, 47·63 kilomètres in length, and 76 kilomètres of the main line, namely, from Vera Cruz to Paso del Macho, being open, as are also 6 kilomètres from the city of Mexico itself, to the Convent and Village of Guadalupe.

It is possible that a considerable variation in the length of the line may occur, should the Board of Directors decide upon reducing the gradients on the mountainous part of it

from 1 in 25 to 1 in 30, a measure which is under consideration.

The contract for the whole of the line is in the hands of Messrs. Smith, Knight, and Co., of London, who have stipulated to complete it by the 1st of January, 1870.

A line, 28 kilometres in length, from the port of Vera Cruz to the village of Medellin, has been open to the public for nearly two years past.

The only other railway in course of construction is from the city of Mexico to the town of Chalco, from whence meat, fruit, and vegetables are brought in large quantities.

The Company for constructing this line was formed under the following conditions, by three natives of the city of Mexico, enjoying a good reputation for probity, but whose position in the financial world did not admit of their undertaking any large operation upon credit.

The Imperial Government having advanced them 200,000 dollars, guaranteed by shares in the Company, those individuals to whom shares were allotted were only to pay a call of 5 dollars per share upon the actual completion of each half league of the line; and the first half league having been recently completed, the first call of 5 dollars per share has been made, and most readily paid, in consequence of the confidence inspired by the straightforward conduct of the originators of a scheme of so much public utility, and whose emolument is to consist in the amount of profit arising from the difference in the actual cost of the line and the capital to be subscribed by the shareholders, which amounts to 2,000,000 dollars.

Both the Emperor and Empress are shareholders in the Company.

A contract has been entered into between the Mexican Government and M. Edouard Gautherin, for the establishment of steam mail-packets in the Mexican Gulf, under the denomination of "*Messageries Impériales Mexicaines*," a copy of which contract is subjoined, as well as of the Imperial Decree in connection with the same, and bearing date the 28th January last, forming Annex No. 3.

A prospectus has since been issued for forming a Company for carrying out the same project.

Another concession with a subvention from Mexico for the establishment of steam-packets, to run twice a month, between Vera Cruz and New York, stopping a few hours at Havana, has been verbally made by the Emperor; and

although the Decree containing the definitive conditions has not yet been issued, two of these vessels, called the "Manhattan" and the "Vera Cruz" have already made the voyage.

The electric telegraph has been open from the city of Mexico to the port of Vera Cruz for some time past, as well as from the city of Mexico to Guanajuato, the capital of the State of the same name; and a concession for the construction of the following lines was granted to a French Company, represented by M. Chute, by an Imperial Decree dated the 7th June last:—

From Guanajuato to Matamoras, passing through San Luis Potosi, Saltillo, and Monterey;

From Matamoras to Vera Cruz, passing through Victoria, Tampico, and Tuxpan;

From San Luis Potosi to Durango, passing through Aguascalientes, Zacatecas, Fresnillo, and Sombrerete.

As near as I have been able to ascertain, the following is an approximate calculation of the amount of the revenue and expenditure of the Mexican Empire for the present year:—

Revenue. Dollars.		Revenue. Dollars.	
Maritime Custom-houses ..	9,000,000	Stamped paper, Post, and	
Provincial Custom-houses ..	3,500,000	other small Taxes : ..	1,000,000
Direct taxes	3,000,000		
		Total dollars ..	16,500,000
Expenditure. Dollars.		Expenditure. Dollars.	
Interest of the Foreign debt .	5,000,000	Other Ministries and their	
Interest of the Internal debt .	3,000,000	Offices	1,000,000
Imperial House	4,000,000	Army and Navy	10,000,000
Works at Palaces and Public		Extraordinary expenses ..	2,000,000
Buildings	1,000,000		
Ministry of Foreign Affairs		Total dollars ..	29,500,000
and its Dependencies ..	1,000,000		
Civil and Military Pensions :	1,500,000	Total amount of Expenditure	29,500,000
Ministry of Finance and		Total amount of Revenue ..	16,500,000
Offices	1,000,000		
		Total deficit, dollars .	13,000,000

With reference to this Statement, it may be observed that, next year, it is highly improbable that the maritime Custom-houses should produce as large an amount of revenue as this year, namely, 9,000,000 dollars, on account of the large accumulation of goods existing in the different seaports, as well as in the different warehouses in the capital, so few purchasers arriving from the interior, owing to a general want of confidence and universal feeling of insecurity. It is reasonable to suppose, also, that the Custom-house of Matamoras, especially, will produce much less, on account of the termination of the war in the

United States, which caused so much cotton and other merchandize to be imported from thence into the Empire.

The chief measure as yet adopted by the Emperor for diminishing the financial embarrassments of the country without foreign aid, is embodied in a Decree of the 26th of February last, by which the secularization and nationalization of the property formerly belonging to the Church was confirmed; the first Article of which states that all sales and operations connected with the secularization and nationalization of ecclesiastical property as yet effected in conformity with the laws of June 25, 1856, and 12th and 13th July, 1859, must be subjected to a revision by the Council of State; and thus, although such a revision is doubtless necessary in consequence of the fraud, injustice, and violation of the very laws, in virtue of which the operations were effected, which were carried on, it will cause a most prejudicial delay and of considerable length, owing to the vast number of titles and documents which will have to be submitted to the examination of the Council; notwithstanding this, however, from the great activity with which the work is being proceeded with, the opinion of the Government officials is that in a year and a-half or two years, the Emperor will have acquired at least 6,000,000 or 8,000,000 dollars in property, independently of the pretended or fraudulent sales which may be annulled by the revision of the Council of State.

The number of operations connected with the sales in question which were sanctioned by the Department of Finance, in the city of Mexico alone, amounted, up to the time of the departure of the last President, Juarez, to about 5,400, whilst in the adjacent towns of Tlalpam and Tacubaya, where such operations, although of minor importance, will require equal time for their revision, they are stated to be no less than 1000; and those solely connected with the amounts appropriated to the maintenance of public worship and endowment of religious establishments, and those which have been received by different individuals under various pretexts, and which will now have to be accounted for, to be about 2,100, giving a total of about 8,500 in the capital and its immediate neighbourhood alone: whilst in the districts of Puebla Vera Cruz, Orizaba, San Luis de Potosi, Zacatecas, Oajaca, &c., they are computed to be about 11,500, giving a total of about 20,000 to be submitted to the revision of the Council; and however large the amount

may appear at first sight, it only gives an average of 10,000 dollars per operation, the amount of property possessed by the Mexican clergy previous to the promulgation of the Law of 1856 having been, according the lowest computation, about 200,000,000 dollars, yielding an annual income of about 20,000,000 dollars ; nor must it be lost sight of that the future operations to be effected connected with what has now become the property of the State must be equally presented for revision to the Council of State, increasing its labours to an almost incalculable extent.

The operations already effected in connection with the sale of ecclesiastical property amount to the sum of 24,822,321 dollars, of which those effected by foreigners amount to 9,020,131 dollars ; and the immediate effect of the promulgation of the Decree of the 26th February last, however beneficial it may prove in its ultimate results, will almost inevitably be a certain paralyzation of all industry connected with agriculture, building speculations, or any spirit of enterprize which may exist, based upon a consciousness of undisputed ownership and of absolute possession.

Mexico, August 12, 1865.

CHEMIN DE FER DE VERA CRUZ.

MAXIMILIEN, Empereur du Mexique,

Vu les Décrets du 31 Août, 1857, et du 5 Avril, 1861, qui ont concédé à M. Antonio Escandon le privilège d'un chemin de fer de Mexico à Vera Cruz ;

Vu le projet de transférer cette concession à la Compagnie Impériale Mexicaine, en date du 19 Août, 1864 ; et

Considérant l'importance de cette œuvre destinée à donner un élan extraordinaire aux transactions commerciales et industrielles du pays, et la nécessité d'en réaliser la prompte et complète exécution, même aux prix de grands sacrifices ;

Vu l'opinion du Conseil d'Etat et entendu notre Conseil des Ministres ;

Nous avons décrété et décrétons :

Le transfert de la ligne du chemin de fer de Vera Cruz à Mexico, fait par son propriétaire M. Antonio Escandon à la Compagnie Impériale Mexicaine, représentée par son fondé de

pouvoirs M. Saunders, est approuvé conformément aux clauses et sous les conditions stipulées dans le contrat annexé.

Notre Ministre de Fomento est chargé de l'exécution du présent Décret, qui sera publié dans le Journal Officiel, et déposé dans les archives de l'Empire.

Donné au Palais de Mexico, le 26 Janvier, 1865.

(Signé) MAXIMILIEN.

Par l'Empereur :

Le Ministre d'Etat,

(Signé) VELAZQUEZ DE LEON.

MAXIMILIEN, Empereur du Mexique,

Pour assurer l'accomplissement ponctuel de la partie de la Convention passée avec la Compagnie Impériale Mexicaine relative à la construction du chemin de Vera Cruz à Mexico,

Nous avons décrété et décrétons ce qui suit :

Art. 1. Le droit additionnel de 15 pour cent pour le dit chemin de fer, auquel se réfère le Décret en date de ce jour, sera perçu dans les douanes maritimes et frontières, en argent effectif ou en valeurs sur cette capitale à trois jours de vue, à l'ordre de la caisse centrale, depuis le jour où parviendra le présent Décret.

Art. 2. Le Ministère des Finances réunira le produit du dit 15 pour cent pour lui attribuer l'application à laquelle il est destiné.

Art. 3. La perception à laquelle se réfère l'Article 1 s'exécutera pendant une période de cinq ans, compté du 1 Janvier de cette année.

Art. 4. Est suspendu, pendant la période à laquelle se réfère l'Article précédent, le droit additionnel d'amortissement de la dette publique intérieure, dont traite l'Article 11 de l'Ordonnance générale des douanes maritimes et frontières, en date du 31 Janvier, 1856.

Art. 5. Chaque trimestre sera effectuée la liquidation de ce qui aura été perçu dans les douanes maritimes et frontières pour le dit 15 pour cent, afin d'être remis à la Compagnie Impériale Mexicaine, recevant de cette Compagnie, en échange, des actions du chemin de fer pour une valeur équivalente, celles-ci étant estimées au pair.

Art. 6. Les dites actions seront inaliénables et ne porteront pas intérêt pendant la construction de la ligne.

Art. 7. Les dites actions seront conservées au Ministère des Finances comme valeurs appartenant à l'Etat, pour que le Gouvernement en dispose comme il le jugera convenable.

Le Ministre des Finances est chargé de l'exécution du présent Décret, qui sera déposé dans les archives de l'Empire, et publié dans le Journal Officiel pour qu'il vienne à la connaissance de qui de droit.

Donné au Palais de Mexico, le 26 Janvier, 1865.

(Signé) MAXIMILIEN.

*Convention avec la Compagnie Limitée Impériale Mexicaine du
Chemin de Fer de Vera Cruz.*

Le 23 Janvier, 1865.

Entre le Ministre de Fomento au nom de l'Etat, et sous réserve de l'approbation de la présente par Décret de Sa Majesté l'Empereur,—d'autre part,

Et la société établie à Londres, sous le titre de Compagnie Impériale Mexicaine limitée, représentée par M. Saunders en vertu de pouvoirs accordés par le Conseil d'Administration de la dite Société en date du 1 Novembre, 1864,—d'autre part ;

A été dit et convenu ce qui suit :

Art. 1. La Compagnie est reconnue comme concessionnaire d'un chemin de fer de Vera Cruz à Mexico, par Orizaba et Cordova, avec un embranchement sur Puebla.

Sauf le cas de caducité, prévu par l'Article 14 de la présente Convention, ce chemin de fer est propriété de la Compagnie au même titre que peuvent l'être de toute personne les biens immeubles, mais le privilège qui lui est concédé pour éviter la concurrence qui pourrait résulter de la construction de quelque autre ligne de chemin de fer qui passerait par les mêmes localités intermédiaires, est limitée à un délai de 65 ans comptés du 1 Janvier, 1865.

Art. 2. Si le Gouvernement juge convenable d'établir des ramifications qui viennent se rattacher à un point quelconque de la ligne, la Compagnie aura le droit de préférence pour leur construction, aux mêmes conditions que celles qui seront proposées. Mais si la Compagnie les exécute d'après des projets établis par des personnes ou des compagnies étrangères, celles-ci recevront de la Compagnie Impériale une juste indemnité pour leur frais d'étude.

Art. 3. Les terrains nécessaires à la construction de la ligne ou de ses dépendances seront concédés libres de toute charge à la Compagnie, s'ils appartiennent à l'Etat. Leur valeur sera payée à prix d'expertise, selon les lois d'expropriation pour cause d'utilité publique, s'ils appartiennent aux Départements, aux municipalités ou à des particuliers.

La valeur fixée de cette manière pourra être payée, soit en action, soit en argent, à la volonté de la Compagnie, quand il s'agira de propriétés appartenant aux municipalités ou aux départements.

Art. 4. Les matériaux de construction de provenance nationale ou étrangère, les marchandises ou autres objets qui seront nécessaires pour la construction et pour l'usage du chemin de fer, de même que toute espèce de trains et accessoires, machines, voitures, outils, maisons, bureaux, ateliers, stations, charbon de terre, animaux, appareils et harnais, les vivres pour les ouvriers, seront libres de tous droits et impôts pendant dix ans, comptés de ce jour.

Le chemin de fer lui-même ne pourra être grevé d'aucune espèce d'impôts ni contributions pendant la durée de dix ans, comptés depuis la mise en exploitation de la ligne entière.

Art. 5. La quantité d'argent que, d'après les exemptions

accordées dans l'article antérieur. la Compagnie pourra exporter libre de droits, n'excédera jamais la valeur des objets demandés à l'étranger, calculées d'après les devis qui en seront présentés au Gouvernement. La Compagnie pourra également, pendant une période de vingt-cinq années, à partir du 1 Janvier, 1856, exporter libre de tous droits jusqu'à concurrence de 560,000 piastres par an, pour le paiement des crédits et l'extinction des emprunts qu'elle aura contractés hors du pays.

Art. 6. Les mines ou gisements de charbon de terre et de sel, eaux minérales, fossiles et autres matières souterraines exploitables qui se rencontreront dans les travaux et fouilles faits sur la ligne du chemin de fer ou sur ses embranchements, seront pleine propriété de la Compagnie, en tant que celle-ci se soumettra aux réglemens prescrits dans l'Ordonnance sur les mines et sans interrompre la continuation du même chemin de fer ni causer préjudice à des tiers.

Art. 7. Les plans généraux de la ligne étant déjà approuvés, les modifications que la Compagnie voudrait y introduire devront être soumises à l'approbation du Gouvernement.

Art. 8. Les Tarifs seront réglés sur les bases suivantes pour l'époque à laquelle la ligne entière de Vera Cruz à Mexico sera mise en exploitation :—

1re classe 100 piastres par tonne de 1,000 kilogrammes.

2me „ 90 „ „

3me „ 80 „ „

Il est établi trois classes de voitures pour les voyageurs. Le tarif de la 1re classe sera établi proportionnellement aux bases adoptées pour les marchandises, de manière que les voyageurs de 3me classe ne paient pas plus de la moitié de ceux de 1re classe.

Sur les prix qui précèdent, il sera fait une diminution de 15 pour cent, pendant les dix premières années de l'exploitation de toute la ligne.

Après ces dix années, il sera fait sur les tarifs une nouvelle diminution de 10 pour cent.

Après les vingt premières années, une Commission composée du Ministre de Fomento et des Travaux Publics, du Gouvernement de la Banque Impériale et d'un représentant de la Compagnie, décidera si l'intérêt public, combiné avec celui de la Compagnie, exige qu'il soit fait un nouveau rabais dans les tarifs, mais sans empêcher que la Compagnie distribue à ses actionnaires un dividende qui ne sera pas moindre de 12 pour cent par an.

Il est bien entendu que toute diminution de Tarif proposée par la Compagnie dans le but d'augmenter l'importance de ses transports sera toujours bien accueillie par le Gouvernement.

Art. 9. La Compagnie du chemin de fer Impériale Mexicaine, dûment constituée d'après ses statuts, comme Compagnie Anonyme limitée, aura les droits et les obligations d'une Compagnie Mexicaine et sera assujettie à la juridiction des tribunaux du pays.

Art. 10. La Compagnie s'engage à livrer la ligne entière au service public dans le délai de cinq ans comptés du 1 Janvier, 1865, sauf le cas de force majeure dûment prouvé.

Aucun plan, de ceux qui doivent-être mis en exploitation

pendant cette période, ne pourra être mis en service avant que le Gouvernement se soit assuré qu'il peut être employé sans danger pour les voyageurs.

La suspension de travaux, sans juste motif dûment prouvé, entraîne pour les concessionnaires, comme amende, la perte des sommes que le Gouvernement aurait dû leur payer pendant la durée de la dite suspension.

Art. 11. Le Gouvernement paiera à la Compagnie jusqu'à complet remboursement, la somme de 140,000 piastres chaque trimestre, pendant une période de vingt-cinq ans, comptés du 1 Janvier, 1865, pour l'amortissement du capital et le paiement des intérêts, à raison de 5 pour cent par an, du fond de 8,000,000 de piastres créé par Décret du 31 Août, 1857, en faveur du propriétaire de la ligne. En cas de retard dans le dit paiement, pour six mois, la Compagnie sera considérée par le Gouvernement de la même manière que ses créanciers privilégiés, dont les créances n'appartiennent à aucune convention diplomatique.

Art. 12. Le Gouvernement se réservant l'exploitation des lignes télégraphiques, le télégraphe que la Compagnie est autorisé à établir pour le service exclusif de la ligne sera soumis en tout temps à son intervention.

La Compagnie est autorisée à établir une garde suffisante pour maintenir sur toute la ligne la sécurité nécessaire; les agents qui seront désignés à cet effet au Gouvernement recevront des pouvoirs officiels suffisants pour arrêter les personnes coupables, soit d'infraction aux règlements de police de la voie, soit de délits ou de crimes, lesquelles seront remises à l'autorité compétente.

Art. 13. Les transports de troupes et de munitions de guerre, faits par ordre du Gouvernement, en vertu de communications envoyées d'office à la Compagnie, jouiront d'un rabais de 75 pour cent sur le tarif.

Mais, en aucun cas, le prix de ces transports ne sera inférieur aux frais d'exploitation qu'ils exigeront.

Sur la proposition du Gouvernement, les immigrants pourront jouir d'avantages analogues, quand leur nombre sera suffisant.

Le service de la poste sera gratuit, mais la Compagnie prendra les mesures qu'elle croira opportunes pour que, sans entraver la marche régulière du dit service, il ne résulte pour elle aucun préjudice notable.

Art. 14. La Compagnie ne pourra vendre ni céder le droit de concession dont il est question, sans l'autorisation préalable du Gouvernement.

La Compagnie se met dans le cas de perdre ses droits, si, dans le terme fixé par l'Article 10, elle ne livre pas à la circulation la ligne entière, sauf toujours le cas de force majeure dûment prouvé, et le Gouvernement mettra en adjudication l'achèvement des travaux, après estimation faite préalablement de ceux effectués, des matériaux réunis et des plans du chemin de fer déjà employés, dont il sera tenu compte de la valeur à la Compagnie.

Si, à l'expiration d'un délai déterminé, il ne se présente pas d'adjudicataires, la Compagnie perdra définitivement tous ses droits.

Art. 15. Pour faciliter les travaux de l'entreprise, le Gouvernement s'engage à payer à la Compagnie pendant cinq ans à partir du

1 Janvier, 1865, le 15 pour cent de droits additionnels qui seront perçus conformément au Décret daté du même jour que cette Convention.

En échange, le Gouvernement recevra, pour une somme équivalente, des actions du chemin de fer Impérial de Mexico, estimées au pair.

Ces actions seront inaliénables et, de plus, ne porteront pas intérêt pendant la construction de la ligne.

Art. 16. Les questions qui pourront se présenter au sujet de l'exécution de la présente Convention seront jugées par des arbitres, et, s'il y a lieu, soumises au Conseil d'Etat.

Art. 17. La Compagnie s'engage à observer les règlements faits en faveur de la sécurité publique, et, à cet effet, de maintenir la sûreté de la ligne et l'usage des voies de communication qui la traverseront.

Art. 18. La Compagnie appliquera à l'amortissement des bons, mentionnés dans l'Article 18 de la concession de 1861, un 20 pour cent du produit net existant après le paiement des 6 pour cent à ses actionnaires.

Le Ministre de Fomento,
(En l'absence de son Excellence, le Sous-Secrétaire.)
(Signé) MANUEL OROZCO Y BERRA.
Comme Représentant de la Compagnie,
TOMAS C. SAUNDERS.

(Annex 3.)—*Imperial Decree, January 26, 1865.*

MESSAGERIES IMPÉRIALES MEXICAINES.

Contrat entre le Gouvernement de Sa Majesté Impériale Maximilien I et M. Edouard Gautherin, Armateur,

Il a été convenu ce qui suit :

Article 1. Le Gouvernement de Sa Majesté Impériale accorde à M. Edouard Gautherin un privilège pour l'établissement des lignes de paquebots poste du Golfe du Mexique, sous le nom de Messageries Impériales Mexicaines, et aux conditions ci-après énoncées.

Art. 2. La Compagnie sera Mexicaine, et, dans le cas contraire, ses membres renonceront, pour tout ce qui concerne la présente entreprise, à leurs droits d'étrangers. La Compagnie pourra se constituer comme société en commandite ou anonyme, par actions et avec l'autorisation du Gouvernement de Sa Majesté Impériale. Dans le cas où elle ne pourrait pas réunir le capital nécessaire au moyen des souscriptions Mexicaines, le concessionnaire aura la faculté de le réunir ou de le compléter à l'étranger.

Art. 3. Les bâtiments des Lignes du Golfe porteront le pavillon Mexicain et seront nationalisés conformément aux lois en vigueur.

Art. 4. Les bâtiments seront à vapeur, de la capacité nécessaire, et construits spécialement pour les services auxquels ils sont destinés, d'une marche supérieure et d'une construction solide.

La coque des bâtiments sera en bois, doublé et chevillé en cuivre rouge, l'expérience ayant démontré les inconvénients qui résultent de l'emploi des navires en fer dans les eaux chaudes du Golfe, surtout lorsque les voyages doivent s'effectuer périodiquement et à grand vitesse.

Les poutres et pièces principales de l'acastillage seront en bois de teck.

Les pièces longitudinales intérieures, les baux du tillac, les carlingues et autres assemblages seront en fer et lames de mer. Ce système offre des garanties de grande solidité, sans diminuer la marche du bâtiment.

Les machines, à condensateurs, auront deux hélices à quatre ailes ; les hélices fonctionneront ensemble ou séparément à volonté.

Les chaudières seront tubulaires et l'ensemble de la machine devra être aussi parfait que possible.

Les dépôts de charbon seront d'une capacité suffisante pour recevoir 150 tonneaux de combustible.

La cale aura trois divisions ; la mâture sera celle d'une goelette à trois-mâts, avec voile de fortune à la proue.

Enfin l'équipage, de même que les chaines, câbles, amarres, voiles et autres objets de l'inventaire, seront suffisantes et en rapport avec le genre de traversée que les vapeurs auront à effectuer :—

Longueur de chaque navire à la ligne de

flottaison 56 mètres.

Largeur en dehors des membrures .. 7 "

Creux sous barrots .. 4.50 "

Tirant d'eau à l'arrière [maximum] .. 3 "

Puissance de la machine exprimée en chevaux de 200 kilogramètres sur le piston. [Construction de Mazeline] .. 100 chevaux.

Soit 266 chevaux Anglais (de Watt).

Vitesse par heure, terme moyen .. 11 milles.

Déplacement .. 650 tonneaux.

Dimension des cales à marchandises, de 160 à 175 tonneaux.

Couchettes pour passagers de première classe, 50, plus ou moins.

Les bâtiments de la Compagnie auront :

2 ancres de bossoir ;

2 ancres à jet à l'arrière ;

1 ancre de miséricorde dans le cale ; 1 cable : 2 grelins ; 2 ausières ; 1 chaloupe assez forte pour mouiller l'ancre de miséricorde ou une ancre à jet.

Chaque ancre de bossoir recevra une chaîne de 120 brasses de longueur ; 4 maillons de chaîne en plus seront dans le cale pour les éventualités ; 4 canons rayés du calibre de 12 avec 12 coups par pièce sur les vapeurs destinés aux voyages de la haute mer ; 2 canons rayés, comme les précédents, avec 12 par pièce pour les bateaux de cabotage ; 12 revolvers avec 36 cartouches pour chaque ; 12 carabines avec 50 cartouches pour chaque ; 12 sabres.

Une soute comme celles des bâtiments de guerre, installée à

l'arrière et pourvue d'un ou plusieurs robinets pour l'inonder en cas d'incendie à bord.

Les munitions de guerre seront complétées chaque mois. A cet effet, le capitaine et l'officier de douane du bâtiment demanderont à l'Administration des Douanes les munitions nécessaires, en appuyant leur demande d'un état des munitions du bord, signé par les deux employés.

Les munitions seront au compte de la Compagnie.

Les vapeurs des Messageries Impériales Mexicaines seront tenus de porter au mât de misaine le pavillon de la Douane.

Chaque bateau admettra deux mousses Mexicaines et le tiers de l'équipage sera également Mexicain, quand faire se pourra. Chaque bâtiment aura à bord un docteur médecin avec une boîte de chirurgie et une pharmacie.

Art. 5. Il sera fait, aux moins, deux voyages d'aller et retour par mois.

Art. 6. Les vapeurs des Messageries Impériales Mexicaines parcoureront tous les ports ouverts au commerce de la haute mer et du cabotage, de la manière suivante :—

PREMIERE LIGNE.

De Vera Cruz à la Havane, avec escale à Sisal.—Départs le 5 et le 20 de chaque mois.

Le voyage aller et retour s'effectuera en 153½ heures de navigation et 96 heures de station dans les ports, c'est-à-dire, en 10 jours et 9½ heures.

SECONDE LIGNE.

De Vera Cruz à Campeche, avec escales à Tabasco et Carmen.—Départs le 1 et le 15 de chaque mois.

Le voyage aller et retour s'effectuera en 66 heures de navigation et 80 heures de station dans les ports, c'est-à-dire, en 6 jours et 2 heures.

TROISIEME LIGNE.

De Vera Cruz à la Nouvelle-Orléans avec escale à Tampico.—Départs le 1 et le 15 de chaque mois.

Le voyage aller et retour s'effectuera en 204 heures de navigation et 168 heures de station dans les ports, c'est-à-dire, 15 jours et 12 heures.

QUATRIEME LIGNE.

Malgré la difficulté d'établir des règles fixes pour l'itinéraire de cette ligne, à cause du déchargement, du mauvais temps, quand règne le vent du nord, et étant obligé de mouiller souvent de nuit, la Compagnie devra faire deux voyages par mois au sud et deux au nord, prenant pour base le tableau suivant :

LIGNE DE CABOTAGE DU SUD.

Départs le 1 et le 16 de chaque mois.

Le voyage aller et retour s'effectuera en 35 heures de navigation et 64 heures de station dans les ports, c'est-à-dire, que l'on pourra calculer le retour pour le sixième jour.

T

LIGNE DE CABOTAGE DU NORD.

Départs le 8 et le 24 de chaque mois.

Le voyage aller et retour s'effectuera en 34 heures de navigation et 46 heures de station dans les ports, c'est-à-dire, que l'on pourra calculer le retour pour le cinquième jour.

Nota.—Les bateaux exécuteront leurs voyages dans l'espace de temps ci-dessus fixé, sauf les cas d'empêchement forcé qui seront constatés conformément aux usages maritimes, et au moyen de procès-verbaux qui établiront les causes du départ. Dans le cas contraire, on accordera un délai de 24 heures, pour l'arrivée du vapeur qui sera resté en retard. Ce délai passé, si le bateau n'était pas en vue, la Compagnie devra payer une amende de 8 piastres pour chaque heure de retard.

De toute manière, on ne pourra exiger que les bateaux à destination des ports indiqués dans le tableau de la Quatrième Ligne, ou ceux du cabotage, accomplissent leur voyage avec une rapidité dépassant neuf milles par heure, comme terme moyen.

Art. 7. Un agent, dûment autorisé par le Gouvernement Impérial, aura, sur chaque bateau, son passage gratis sans frais de tables ni autres ; il sera chargé de la correspondance et sera aidé par le capitaine, afin qu'il n'y ait pas de retard dans le débarquement de la correspondance.

Art. 8. Les bateaux de la Compagnie ne paieront ni droit de port ni de phare, mais ils auront toujours à payer les droits de pilotage, dans les ports où les pilotes ont l'habitude d'aller au devant des bateaux qui sont en vue des côtes, ou à l'entrée des ports, afin de les diriger au milieu des écueils et de les conduire au mouillage.

Les embarcations, lanchas et marchandises des vapeurs seront soumises aux Ordonnances de douanes maritimes et aux dispositions en vigueur pour tout ce qui a rapport au trafic mercantile.

Art. 9. Quand le Gouvernement Impérial enverra des troupes, munitions ou matériel de guerre d'un point à un autre, il payera seulement à la Compagnie la moitié des prix établis. Les employés du Gouvernement de Sa Majesté Impériale jouiront des mêmes bénéfices. Les officiers civils et militaires auront droit à la première classe, sans frais de table ; les sergents auront droit au passage de deuxième classe, sans frais de table ; les caporaux et soldats auront droit au passage de troisième classe, et la Compagnie leur fournira seulement l'eau et le sel.

Art. 10. Trois mois après la signature de ce contrat la Compagnie déposera aux archives Impériales la somme de 4,800 piastres, comme cautionnement, qui lui seront rendus quand les lignes seront établies, avec les vapeurs cités dans l'Article 4. De plus, la Compagnie est obligée à avoir trois mois après la signature du présent contrat, des bateaux provisoires qui feront : au moins un voyage mensuel de haute mer, au moins deux voyages mensuels de cabotage.

La Compagnie devra faire par an : deux voyages mensuels de haute mer, deux voyages mensuels de cabotage.

Pendant la première année, la Compagnie emploiera au moins

quatre vapeurs, dont la marche devra atteindre 9 milles comme terme moyen. Un an et un jour après la signature du présent contrat, la Compagnie devra présenter six vapeurs ; quatre dont la marche atteindra 11 milles comme terme moyen, et deux, 9 milles.

Le Gouvernement de Sa Majesté Impériale se réserve le droit de choisir le port ou le point central de départ et d'arrivée des bateaux de la Compagnie, et où il doit établir ses chantiers de carénage, chantiers de construction, digues, ateliers, magasins, et édifices pour le logement des employés et ouvriers. Le Gouvernement de Sa Majesté Impériale s'engage à en donner avis en temps opportun à la Compagnie dans le délai d'un an après la signature du présent contrat. Deux mois après la réception du susdit avis, la Compagnie devra commencer les travaux de construction, sur les terrains que le Gouvernement lui concédera à cette fin, et dont les plans seront présentés préalablement à l'approbation du Gouvernement.

Le Gouvernement donnera avis également en temps opportun, pour construction des jetées et brise-lames dont la Compagnie aurait besoin, et dont parle l'Article 12 qui suit.

Art. 12. Le Gouvernement de Sa Majesté Impériale accorde à M. Edouard Gautherin le privilège pour la construction des jetées et brise-lames dans les ports et rades d'escale des vapeurs, et l'autorise à recouvrir au commerce un droit de transit ou dépôt pour les marchandises embarquées ou débarquées par ces jetées ou brise-lames.

Le droit de transit ou dépôt sera de 10 centavos par barril ou 5 pieds cubes, soit 80 centimes pour un volume d'un tonne ; et 10 centavos pour 200 livres de marchandises, telles que fer, plomb, rails, machines, minéraux, &c., &c.

Le Gouvernement de Sa Majesté Impériale aura le 20 pour cent de ce droit. Les colis et matériaux du Gouvernement et de l'entreprise resteront seuls exempts du droit ci-dessus mentionné.

La perception des droits de jetées et brise-lames se fera au moyen d'un registre établi en double expédition dans les Bureaux de l'Entreprise et de l'Administration des Douanes. Les deux livres seront confrontés le dernier jour de chaque mois, et l'on fera sur le champ la répartition des sommes perçues.

Les jetées qui se construiront seront en bois, comme celles qui sont en usage aux Etats Unis du Nord (New York, Boston, Nouvelle Orleans), la Havane, les Indes, et l'Australie. La construction de ces jetées pourra varier suivant les exigences des circonstances, en remplaçant le bois par la maçonnerie et les matériaux présentant le plus de résistance ; mais la Compagnie devra préalablement demander l'autorisation du Gouvernement de Sa Majesté Impériale.

Art. 13. Les vapeurs feront sur la ligne le service de garde-côtes. Un officier du Gouvernement Impérial restera à bord avec la mission spéciale et exclusive de visiter les navires suspects, de les capturer, et de dresser le procès-verbal des prises, d'accord avec le rapport du capitaine du vapeur. L'officier chargé de la correspondance pourra remplir ces fonctions, si le Gouvernement de Sa Majesté Impériale le jugeait convenable.

Le produit de la vente des prises, marchandises, navires et embarcations, sera partagé également entre le Gouvernement Impérial et le concessionnaire, qui payera *ad valorem*, et suivant le Tarif, les droits dûs au fisc pour sa part de prise.

Quand l'officier délégué par le Gouvernement de Sa Majesté Impériale voudra exiger du capitaine du vapeur qu'on visite quelque navire en vue, il devra le déclarer par écrit.

Le capitaine sera tenu de se conformer à l'exigence de l'officier du Gouvernement, et il en sera pris acte dans le livre de bord, aussi bien que de l'itinéraire parcouru, en le calculant à raison de 9 milles à l'heure ; et le temps perdu pendant la visite sera porté en compte, si le vapeur en éprouvait quelque retard pour arriver à sa destination.

Le Gouvernement de Sa Majesté Impériale n'aura aucune indemnité à payer pour les pertes de temps occasionnés par les visites pratiquées par ordre de son agent.

Art. 14. Les vapeurs des Messageries Impériales Mexicaines transporteront la correspondance ; mais, outre le port d'usage perçu par l'Administration des Postes, celle-ci prendra, pour le compte de la Compagnie, un port additionnel, dont il livrera le montant au moment du départ de chaque vapeur et de l'embarquement des sacs de correspondance. Ces sacs seront pesés en présence d'un employé de la Compagnie.

Pour les sacs contenant des journaux, brochures et imprimés, la Compagnie percevra 2 réaux par arrobe.

Pour les journaux, brochures et imprimés dont le poids est de 1 à 15 onces, la Compagnie percevra 3 ceutimes.

Pour fixer le montant de la somme perçue par l'Administration des Postes, pour le compte de la Compagnie, on prendra pour règle le poids des sacs.

En déduisant du poids total le poids du sac vide on obtiendra le poids net des lettres et des journaux.

Chaque $\frac{1}{4}$ once de poids de correspondance représentera le poids d'une lettre simple.

Le port que l'Administration des Postes percevra pour le compte de la Compagnie sera réglé provisoirement de la manière suivant :

D'un point du Golfe à un autre quelconque du même Golfe, pour une lettre simple de $\frac{1}{4}$ once il sera perçu 1 réal.

Pour une lettre simple du même poids destinée à la Havane on percevra 2 réaux.

Le Gouvernement de Sa Majesté Impériale se réserve le droit de modifier les prix qui précèdent, dans le cas qu'il lui conviendrait de réformer le Tarif des Postes, et de faire des Traités Postaux avec les Puissances étrangères et amies.

Quand le Gouvernement aura résolu de faire la réforme des Tarifs, il nommera une Commission chargée de leur révision, et il invitera la Compagnie à nommer un chargé de pouvoir qui défendra ses intérêts auprès de la Commission.

Art. 15. La Compagnie s'engage à établir ses ateliers, bassins de carénage, magasins, et chantiers, sur l'emplacement choisi par le Gouvernement de Sa Majesté Impériale, dans le délai d'un an,

ainsi qu'il est stipulé à l'Article 11. Le point désigné provisoirement comme centre des lignes de vapeurs des Messageries Impériales Mexicaines est le port de Vera Cruz.

Dans le cas où le Gouvernement de Sa Majesté choisirait un autre point comme centre des lignes, la Compagnie pourra modifier les dimensions de ses bâtiments, après approbation des Ministres de Marine et des Finances.

Afin de procurer du travail aux populations voisines des chantiers et des bassins de carénage, et de favoriser l'exploitation des bois, mines, &c., la Compagnie s'engage à employer, autant que possible, les habitants du pays et les matériaux qu'il produit, comme bois, cuivre, fer, charbon de pierre, &c., &c.

Art. 16. Les chantiers et bassins de carénage de la Compagnie seront toujours à la disposition du Gouvernement pour tout ce qui concerne la construction et la réparation de son matériel maritime.

Art. 17. Les embarcations à voile, à vapeur, ou à rames appartenant à la Compagnie, seront considérées comme appartenant aux ports où ils sont employés, et jamais comme des embarcations de haute mer ou de cabotage.

Art. 18. Le terme de la concession est de vingt et un ans, à dater du jour de la signature du présent contrat. À l'expiration de la concession, les constructions faites sur terre, les chantiers, bassins de carénage et ateliers, jetées et brise-lames, deviendront la propriété du Gouvernement.

Le Gouvernement de Sa Majesté pourra acquérir le matériel flottant, c'est-à-dire, les vapeurs, lanchas et embarcations de la Compagnie, moyennant une indemnité dont le chiffre sera fixé par une Commission d'experts nommée par le Gouvernement de Sa Majesté Impériale et par la Compagnie.

Art. 19. Le concessionnaire fera conduire le plus tôt un vapeur désarmé, à lui appartenant et qui se trouve actuellement dans les bassins de la Havane. Ce vapeur, une fois armé, sera destiné au service du port de Vera Cruz à la rade de Sacrificios. Il sera employé au déchargement des navires et restera à la disposition du Gouvernement pour toutes les nécessités du service.

Le concessionnaire emploiera au service des rivières qui débouchent à Alvarado un autre vapeur à lui appartenant, le 'Graville,' qui se trouve actuellement à la Havane, attendant des ordres. Le Gouvernement pourra y transporter gratuitement ses troupes et la correspondance le long des dites rivières jusqu'à Alvarado.

Art. 20. Sauf dans les cas imprévus ou de force majeure, les vapeurs de la Compagnie devront se présenter en vue des ports d'escale ou des stations, quelque temps qu'il fasse. Dans l'impossibilité de communiquer avec la terre, le capitaine de port en donnera avis au moyen de signaux. Dans ce cas, seulement les vapeurs seront dispensés de débarquer les passagers, la correspondance et les marchandises.

Les vapeurs effectueront leur départ les jour et heure indiqués, sauf dans les cas de force majeure dûment constatés. En cas de mauvais temps, ils ne pourront prendre la mer sans l'autorisation de l'autorité maritime.

La Compagnie est responsable de toute infraction aux réglemens qui précèdent.

Art. 21. Un inspecteur délégué par le Gouvernement Impérial visitera fréquemment les bâtimens de la Compagnie. Si l'inspecteur considèrait qu'il est urgent de faire quelques réparations, il devra en informer l'autorité maritime ; et une Commission composée du capitaine du port, de l'inspecteur, et du capitaine ou patron le plus ancien du port, se transportera à bord et prescrira les réparations à faire.

L'autorité maritime veillera à ce que le capitaine de bâtiment fasse exécuter les réparations demandées par la Commission.

Art. 22. Lorsque le Gouvernement Impérial emploiera un ou plusieurs bâtimens de la Compagnie, il paiera une indemnité dont le chiffre sera fixé par une Commission nommée à cet effet et qui accueillera les observations de la Compagnie.

Art. 23. Si quelque fait de contrabande se produisait à bord des vapeurs de la Compagnie, les coupables seraient poursuivis selon toute la rigueur de la loi, conformément aux lois de l'Empire, pour vol et abus de confiance, et le capitaine du bâtiment sera immédiatement destitué.

Art. 24. Le prix maximum du transport des passagers et du fret des marchandises est fixé dans les Tarifs ci-joints, lesquels pourront être révisés par le Gouvernement de Sa Majesté Impériale, s'il le juge convenable. Il sera nommé à cet effet une Commission qui entendra les observations de la Compagnie.

Art. 25. Considérant les mauvais temps qui règnent fréquemment dans le golfe, surtout depuis le 1 Novembre jusqu'au 1 Février, ainsi que les avaries et retards que les bâtimens de la Compagnie peuvent souffrir, le Gouvernement de Sa Majesté Impériale autorise la Compagnie à percevoir 10 pour cent de plus sur les prix des Tarifs ci-joints.

Art. 26. Le Gouvernement de Sa Majesté Impériale accorde sa haute protection à la Compagnie des Messageries Impériales Mexicaines, et s'engage à refuser à quelque autre Compagnie que ce soit, toute subvention ou concession de privilèges pouvant lui porter préjudice.

Chapultepec, le 28 Janvier, 1865.

MAXIMILIEN.

REPORTS
BY
HER MAJESTY'S SECRETARIES
OF
EMBASSY AND LEGATION,
ON THE
MANUFACTURES, COMMERCE, &c.,
OF THE
COUNTRIES IN WHICH THEY RESIDE.

No. 12.

*Presented to both Houses of Parliament by Command of Her Majesty.
March 1866.*

LONDON:
PRINTED BY HARRISON AND SONS.
1866.

Netherlands.

Reports by Mr. Ward, Her Majesty's Secretary of Legation.

Agricultural Statistics and Cattle Disease.

The Hague, January 10, 1866.

As instructions have been addressed to Her Majesty's Legation at this residence, on several occasions during the past year, with reference to the agricultural statistics of the Netherlands, I have thought that it might be useful to prepare a set of Tables, extracted from official sources, in continuation of those published with my Report of the 18th January, 1861, on the agriculture of Holland. The weights and measures of these Tables are reduced to the English scale.

The materials for the compilation of these Tables for the four first years of the period under consideration have been furnished chiefly by the General Annual Reports of the Royal Agricultural Society of Holland, which are themselves compiled from the official Reports of the several provinces, and partly corrected by the information derived from local Agricultural Societies.

For the results of 1864 I have been obliged to put together the details of the provincial Reports published in the autumn of 1865. The statement of imports and exports is extracted from the Tables published by the Finance Department, and issued at the end of the year 1865, containing the statistics of the trade and navigation of the Netherland for 1864.

A great increase will be observed in comparing the results with those for 1859, as printed with my former Report, in the exportation of the staple articles of Dutch agriculture, namely, butter and cheese, as well as in the quantities furnished to the British dominions. The exports of flax to Great Britain, the cultivation of which crop has much extended in this country of late years, appear as nearly double the amount of those of 1859. The same market has also taken increased numbers of cattle. Besides the articles enumerated in this list, large quantities of

vegetables and fruit go from this country to England, the former to the value, for 1864, of 62,850*l.*, out of an aggregate of 105,284*l.*, and the latter in the proportion of 70,000*l.* to 100,000*l.*, the approximate value of the entire quantity exported.

The statements with respect to the quantity of land in meadow and pasture, as well as to the extent and produce of the root crops, are so meagre and imperfect that it has appeared to me useless to include them in this Report. In the *Agricultuaal Society's Reports* the quantity of land under meadow and pasture is stated only for three provinces, namely :—

A statement of the number and description of stock in the Netherlands for the year 1860 to 1864, inclusive, is subjoined.

In connection with this part of the subject, it will be proper to add some details respecting the disease now prevailing among the cattle in this country, as in England, and to give a short account of the means which have been adopted in the hope of arresting its progress. This disease made its first appearance in the Netherlands in the middle of the month of August, and its origin was traced to some cattle which had been brought back from England, where they could not realize a remunerating price.

The infection spread, and the attention of the Government was immediately drawn to the subject. Their action was at first limited to advice, information, and support; since the immediate agency in such cases belonged to the communes, which are empowered to make such regulations as might be found necessary, and to enforce the general laws of the country applicable to the emergency. Certain provisions of the Penal Code indicated the course which might be followed to compel owners of diseased cattle to report any case which might occur where there was any risk of communicating infection; and the general law of expropriation furnished the means of getting rid of such animals as were likely to spread the disease, upon making compensation to the owners. The communal authorities were called upon to exercise the powers conferred upon them by these laws, and the Government encouraged them by the promise of material assistance to such communes as might be unable to meet any demands for compensation. Indirect means were resorted to for the purpose of checking importations of cattle by sea and land, such as prohibiting pilots from bringing up vessels laden with cattle from England, and directing the Customs officers at the frontier to detain such as might come by land, until they could be properly inspected and ascertained to be free from disease. Suggestions adopted upon the recommendation of veterinary practitioners were made public, and urged for enforcement by the communal authorities. The principle of the suggestions was to destroy infected or suspected animals only where the cases were isolated; and where the infection had already spread, to subject them to careful treatment, and to take precautions for separating, as far as possible, the diseased from the healthy. Some communes closed their

cattle markets, and some endeavoured to prevent the spread of infection by prohibiting the passage of animals from places where the disease existed. The Government assisted these latter by placing the military and naval force of the country at their disposition in aid of the police.

Further assistance was also afforded in providing for the service of veterinary surgeons, both for the sake of keeping the authorities informed when their intervention was required, and of treating the diseased cattle. To meet the expense of this measure, as well as with the object of enabling the poorer communes to make compensation for the animals which it might be necessary to slaughter, a sum of 100,000 florins, equal to about 8,400*l.*, was voted by the States General.

A Bill was also passed through the Legislature, extending, for a limited time, the powers of the Administration to the prohibition of importation and transit of cattle, and of holding markets,—to making regulations respecting the declaration, sale, treatment, and inspection of living and dead animals, and other matters in connection therewith. The exercise of these powers was not, however, designed to supersede the action of the communes, but to be supplementary of it; and in pursuance of them, a line has been drawn including the infected districts, and extended from time to time as occasion required, across which the passage of cattle has been prevented by stations of police and military. All markets for the sale of cattle have been suspended within the line of exclusion under these powers, as in some instances the communal authorities neglected or refused to enforce this measure, considered to be indispensable for checking the progress of the plague.

It is stated that the flesh of animals slaughtered in the early stage of the disease is not unfit for human food; and this seems to be proved by the fact that considerable quantities of the meat of such animals had been brought to market after inspection by officers appointed for the purpose, as well as that much also had been sold and consumed previously to the appointment of inspectors, without any dangerous consequences being known to have ensued. Objections against this practice have been offered only upon theoretical grounds.

No specific mode of treatment has been found effectual either to prevent or to cure the disease. Still it cannot be

said that the means used have been altogether fruitless. At any rate the mortality is less than what has been experienced in England. During the first six weeks the number of cases reported was 3,319; of these 674 were slaughtered, 1,169 died, and 717 recovered. Thus, according to the official calculation, 39 per cent. of the cases in which the plague had been allowed to run its course were recoveries, a proportion looked upon as more favourable than could have been expected.

Weekly returns are made to the Government, from which it has appeared that, from the end of September to the 4th of November, the number of new cases per week decreased gradually from 790 to 651. Subsequently to the latter date they have steadily and rapidly increased, a result ascribed to the removal of the animals from pastures to the stalls.

The Returns up to the close of the year have continued to present a progressive increase, the last showing for the week ending December 30, 1865, 3,072 new cases, of which 444 died, 379 were slaughtered, 186 recovered, and 2,063 remained under treatment, making since the beginning of the disease a total of 21,437 attacked, 6,121 died, 5,075 slaughtered, and 5,835 recovered, in the province of South Holland.

In more than one respect, however, the last Return presents an unfavourable appearance. Out of seven places in which the breaking out of the plague is reported for the first time, it is stated that the origin of it cannot be traced to contact with any contagious medium, contrary to the opinion of a high authority upon the subject; that every case would be found to be so traceable. Again, though in the original forms of the disease a diminution is announced, for the first time since the commencement of it, yet in others where it has long raged it has assumed a more aggravated character.

The area over which it is spread is also increasing. Returns have been made for the province of Utrecht, in which a few isolated cases in the early part of the season had been followed by an entire cessation of the scourge, showing, for the week ending December 30, 349 new cases, 165 deaths, 2 slaughtered, and 146 recovered, making a total of 1,104 cases, 394 deaths, 27 slaughtered, 316 recovered, and 367 still under treatment.

The provinces of North Brabant and North Holland

have also been invaded, according to the latest accounts, though no official Returns of the extent of the visitation have been yet made.

(Signed)

WILLIAM R. WARD.

Concise Report for 1865.

The Hague, January 29, 1866.

THE sums voted for the service of the financial year 1865-66, are as follows :—

	Florins	c.
Royal Household	750,000	0
Superior Departments of State	579,688	0
Foreign Affairs	518,182	0
Roman Catholic Worship	679,347	90
Department of Justice	2,956,184	0
Protestant Worship	1,734,693	50
Home Department	23,306,228	5
Marine	9,043,046	0
National Debt	42,504,489	39
Finance Department	11,600,080	50
War Department	12,766,000	0
Colonial Department	3,741,066	0·5
Unforeseen expenses	50,000	0
Total	110,229,005	34·5
About £9,247,400.		

The vote for the Home Department includes, as usual, the expenditure for the construction of the State Railways, and appropriations for other public improvements.

13,500,000 florins are devoted to the former purpose out of the income of the present year, which, together with the unexpended balance of this account for last year, and the profits accruing from the working of the lines already partly opened for traffic, is estimated to amount to 19,000,000 florins.

The increase, upwards of 4,000,000 florins, in the vote for the Finance Department, is to be accounted for chiefly by the cession of revenue to the communes in compensation for the local taxes on consumption abolished by the law passed during the last Legislative Session, which comes into operation on the 1st of May next; and partly also by an indispensable addition to the number of the revenue officers.

To meet the foregoing expenditure, the following sums have been appropriated:—

	Florins	c.
Direct taxes	20,542,457	0
Excise	22,668,000	0
Indirect taxes	13,317,000	0
Import and export duties, &c.	4,200,350	0
Public domain	1,299,500	0
Plate dues	261,500	0
Post Office	2,250,000	0
Telegraphs	447,420	0
Lottery	410,000	0
Game and fishing licenses	105,000	0
Pilotage	700,000	0
Mines	885	50
Profit on railways	50,000	0
Miscellaneous	1,811,103	0
Contribution from Belgium	400,000	0
Last instalment of purchase money of Scheldt dues	3,809,253	34
Interest on arrears of the same	152,370	13
Estimated Colonial surplus for 1866	25,000,000	0
Surplus from 1863	545,000	0
Ditto in part from 1864	12,280,000	0
Total	110,249,838	97

The ordinary branches of the public revenue for 1865 have yielded 64,456,653 florins 41·5 cents, under the following heads:—

	Florins	c.	Florins	c.
Land tax	10,506,861	76		
Personal tax	7,617,145	67		
Patent tax or Licenses	3,269,525	21

Telegraphs	509,982	5·5
Lottery	413,369	50·
Game licenses	113,706	0
Pilotage	728,564	73
Total	64,456,653	41

The excise revenue for the same articles in 1864 was 17,079,870 florins, but in comparing the Returns, the alterations in the rates of duty on spirits must be taken into consideration, as well as the effect of the new regulations respecting the sugar duties. These have already been explained in former reports of mine. On the other hand the duties on fuel received in 1864, brought the total amount of the excise to 19,853,712 florins.

The capital of the national debt is, according to the estimates for 1866,—

		Florins	c.
At 2½ per cent.	..	662,652,170	0
3	..	100,142,011	95
3½	..	14,974,000	0
4	..	194,743,200	0

and the sum required for payment of interest thereon, together with annuities and other annual charges is 27,989,236 florins 0·5 cents, equal to about 2,342,090*l.* sterling.

The total sum appropriated for the redemption of the debt for the financial year 1865-66 is 14,515,253 florins, 34 cents, equivalent to 1,217,722*l.* Of this the last instalment of the purchase-money of the Scheldt dues furnishes 3,809,253 florins 34 cents.

There is a progressive increase in the Customs' revenue. The details of imports and exports for the whole year 1865 are not yet published, but the Returns up to the end of the month of November have been forwarded with the regular correspondence of the Legation. In manufac-

tured goods, the imports of silks have fallen off, but cottons, of which England furnishes the greater portion, show a considerable increase.

In linen and woollen goods the difference between the imports of 1864 and 1865 is trifling. Machinery, iron, cast and wrought, rails and copper, have been imported in increased quantities. In exports there has been a large increase of the staple products of Dutch agriculture, butter, cheese, and cattle, of which by far the largest portion is taken by Great Britain. The quantity of flax, however, exported during eleven months of 1865, has fallen far short of that exported during a like period in 1864.

The official reports of the harvest show that the results have been very unequal in the grain crops, which are, on the whole, below an average. The accounts of most other crops also vary exceedingly; in some places failures are reported, while in others the produce has been abundant. These remarks apply especially to the root crops, and peas and beans. The potato crop has been generally good, but little disease having affected the root. With respect to pasture and meadow there is more uniformity. The drought in the early part of summer was very unfavourable to them, but the later rains so far restored them, as in many places to compensate fully for the earlier loss.

I am obliged to omit some details usually contained in my Concise Reports, as the information respecting them has not yet been published.

(Signed)

WILLIAM R. WARD.

Bavaria.

Mr. Bonar to the Earl of Clarendon.

My Lord,

Munich, January 15, 1866.

I HAVE the honour to inclose to your Lordship herewith a report which I have drawn up of the movements in some branches of the commerce, industry, and other statistics of Bavaria for the last half-year.

Too short a time has elapsed since the coming into force of the Commercial Treaty between the Zollverein and France to allow me to say much as yet of its effects upon the trade and industry of Germany, but at least it is satisfactory to observe that the complaints and anxiety have subsided, which, raised by an interested class, were so loud against that project of Treaty whilst under negotiation.

I have, &c.

(Signed) A. G. G. BONAR.

Inclosure.

Reports by Mr. Bonar, Her Majesty's Secretary of Legation.

Commerce, Industry, &c.

Munich, January 15, 1866.

No considerable movements of real interest and importance have to be recorded in the commerce and industry of Bavaria during the past year. The long uncertain negotiations of the Commercial Treaty between the Zollverein and France, necessarily embarrassed and arrested for a time speculation and enterprize. The expectation of a further Treaty with Italy, now happily concluded, placed the merchant in still greater doubt as to his future position, whilst the effects of the French Treaty, which came into operation only six months ago, cannot yet be correctly appreciated. It is, however, satisfactory to observe that the complaints and anxiety evinced whilst that latter project

of Treaty was still under discussion have subsided, and that there is no indication as yet that the sombre prognostics so continually put forward by the protectionist class are to be realized.

The Returns of the commerce and industry of the many States of Germany are so bound together in the common accounts of the Zollverein, or Customs' League, of which they are all equally members, that it is difficult to follow the movements of any one in particular. A certain time must necessarily elapse before the general Zollverein Returns can be analysed, and the quota, even of the receipts and expenditure, be correctly allotted to each State. But the most minute inquiries would fail to reveal the share which falls to each specially in the various markets of Germany, the commercial intercourse of the Confederate States between each other being without restriction, and without returns, except in some very few articles.

I can hardly, therefore, give further information here than as regards the local activity and produce of Bavaria specially. What becomes of such portion of that produce as is not consumed in the country, or, when exported from Bavaria, whither it goes, is only in rare instances to be ascertained.

As easy would it be to report the precise amount of produce and consumption of any single county of England, and to state with regard to that consumption from what other counties, and in what proportion, the articles were received, or, as relates to that produce, to what other counties, and in what proportion, any surplus might be conveyed.

General Harvest of 1865.—The general harvest of 1865 has been favourable in Bavaria.

The produce has been, as regards quality, above the average in corn of every kind, wheat, rye, barley, and oats, and also in hops, hay, clover, maize, hemp, tobacco, and particularly in wine.

As regards quantity it has also been above the average in barley, potatoes, hops, maize, and tobacco. It has been below the average quantity in rape and wine, owing to the long continued unusual drought.

The potato disease has been rarely observed.

Corn.—Since Munich is known to be the most considerable and busy grain market of all Southern Germany, to such extent indeed that its quotations are by no means without influence upon those of other exchanges, it may

not be uninteresting to give here some insight into its movements during a series of the last ten years, namely, from 1854-55 to 1863-64 inclusive.

TOTAL amount and value of various grain, including wheat, rye, barley, and oats, in the Munich market.

Year.	Total Amount in Bavarian Scheffel.	Total Value realized at the average of Sale Prices.	Year.	Total Amount in Bavarian Scheffel.	Total Value realized at the average of Sale Prices.

1858-59 ..	582,582	6,827,270			
1859-60 ..	695,115	9,457,226	Total ..	6,869,756	91,760,664

Or an average of 686,976 scheffel at 9,176,067 florins.

The highest prices obtained by wheat and rye during that period were, in the year 1854-55, at an average during that year of 30 florins 22 kreutzers for wheat, and 23 florins 19 kreutzers for rye per scheffel, whilst the lowest were in 1858-59 at an average of 15 florins 45 kreutzers for wheat, and 10 florins 28 kreutzers for rye, which latter grain is always in great demand in these countries, being extensively used for bread, and being the meal almost exclusively used by the lower and middle classes.

Hops.—Hops are more largely cultivated in Bavaria than in any country in Europe, excepting England.

Their average annual produce, which thirty years back did not exceed 74,000 cwt., may now be estimated at 180,000 cwt., and the district of Nürnberg has acquired, especially of late years, the highest repute in this branch of cultivation, owing to the favourable nature of its soil, and the care and intelligence devoted to this peculiar produce.

The value of the annual sale of hops in the Nürnberg country alone, during the few market months, attains an average of from 9,000,000 to 12,000,000 florins. But not only knowledge, also much good luck is requisite in the lottery of the hop trade, for that produce is of a delicate and perishable nature, and while some fortunate speculators may soon enrich themselves, many lose in it their whole possessions. The result then of a few critical months or weeks is a life question in hop-growing districts.

The hop harvest of 1865 has been on the whole a favourable one in this country, especially as regards quality,

the long continuous heat having allowed of a thorough drying and ripening of the fruit.

England being a continual and considerable purchaser of Bavarian hops, at times even of the inferior qualities, it may be useful that I should here state the prices now realizing for the produce of the last harvest in this country, namely, according to the various qualities, from 90 florins (7l. 10s.) to 180 florins (15l.), and if other prices than these have been quoted in public print, that has been done on interested and improper motives, though it frequently occurs, and they do not represent the real quotations of the Bavarian market.

The speculations, however, which the holders of hops have lent themselves to, this year in particular, counting on far higher prices than customary, on account of the finer quality of the harvest, have been improvident, have created a disturbance in the trade, and have caused large quantities of hops to remain on hand, even up to a very recent period from this time, and I am told that in the highest reputed districts, of Spalt for instance, seven-eighths of the whole produce of 1865 was still unsold as late as the commencement of November.

The enormous manufacture and consumption of beer in Bavaria continues still to increase, and has nearly doubled in the course of the last fifteen years. Taking the returns of the summer consumption of 1864-65 for the capital alone, we find that thirty-one breweries employed no less than 208,804 scheffel of malt, and produced 769 eimers of beer, yet this ocean of liquid did not suffice to meet the Munich demand during four short months, and the winter stores had to be attacked before that time.

The Munich breweries are now carried on upon a very large scale, and the trade has accumulated in the hands of a few considerable capitalists. Fifteen years ago Munich counted thirty-two breweries, but they produced not half the quantity of beer now annually consumed.

The great excellence and wide reputation of the beer of Bavaria is owing to a peculiar manipulation in the process of brewing. Both what is termed the "concentration" of the wort, and the temperature of the fermentation, are kept much lower by the Bavarian than by British brewers, but, on the other hand, the Bavarian beer, as it is commonly made, will not bear keeping or exporting. It must be drunk within the half-year, and on the spot. The exceedingly

small quantities made for exportation must be differently and specially prepared.

The total number of breweries in Bavaria was given according to the returns of 1861 at 5,385, belonging to 4,507 proprietors, employing 10,477 workmen. It is estimated that they employ annually 1,600,000 scheffel malt, producing circa 11,200,000 eimer of beer, at an approximate value of from 66,000,000 to 67,000,000 of florins.

Beetroot Sugar.—The vast quantities, continually increasing, of beetroot cultivated and manufactured into sugar in the States of the Zollverein, suffice now to meet the whole consumption of Germany, and the refined sugar of the colonies is but rarely met with.

Although nearly a century elapsed before the deserved attention was directed to the discovery by Markgraf, that a saccharine matter almost equal to that of the tropical sugar cane could be extracted from beetroot, yet after the first essays on a large scale, the peculiar adaptation of the soil and climate of Germany to the growth of beetroot gradually raised that branch of agriculture, and the subsequent manufacture of sugar to rank amongst the most considerable enterprizes of the Zollverein.

Having on more than one occasion in these reports already given returns of the amount of beetroot cultivated, and of its produce and value in sugar, as well as of the large revenue derived by the State from excise duty on this branch of industry, I will, in this instance, confine myself to the period of the last five years, namely, from 1859-60 to 1863-64, for which the official returns show as follows :—

Year.	Number of Manufactories.	Amount of Beet root employed.	Year.	Number of Manufactories.	Amount of Beet root employed.
		Cwt.			Cwt.
1859-60 ..	256	34,399,317	1862-63 ..	247	36,719,258
1860-61 ..	247	29,354,031	1863-64 ..	253	39,911,520
1861-62 ..	247	31,692,394			

For the last year 1864-65, the returns showed 270 manufactories, 50,212,090 cwt., and yielding 10,050,680 thalers excise revenue.

Tobacco.—The cultivation of tobacco, which of late had threatened to fall off in Bavaria, has again revived. Indeed, in the year 1863, we find an increase of near 50 per cent. in the number of acres devoted to the growth

of tobacco as compared to the preceding year, or in precise figures in 1862, 10,067 Bavarian acres; in 1863, 15,080 Bavarian acres; showing an increase of 5,013 over 1862, whilst the increase of 1862 over 1861 had been of only 971 acres.

Of the eight circles into which the Kingdom of Bavaria is administratively divided, those of Middle Franconia and the Rhine Palatinate are by far the more advanced as producers of tobacco, and the leaf from the province of the Palatinate is highly esteemed.

Out of 10,000 acres of cultivated land in those provinces were allotted to tobacco:—

	1859.	1860.	1861.	1862.	1863.
In the Palatinate	114	97	73	84	135·2
In Middle Franconia	39	32	28	28	5·2
Whilst for the whole Kingdom the proportion was	16	13	11	11·4	16·2

The harvest of tobacco of 1863 was a favourable one, yielding 9·26 cwt. of dried leaf per acre, and a total of 139,719 cwt. against 83,538 of the preceding year.

The Grand Duchy of Baden, which of all the Southern German States grows the most tobacco, devoted to that cultivation in 1863, 29,468 Prussian acres, against only 20,616 in 1862, whilst its produce amounted in 1863 to 258,409 cwt.; Wurtemberg, with 673 acres, produced 4,351 cwt.; Hesse Electorate, with 1,058 acres, produced 12,881 cwt.; Hanover, with 2,143 acres, produced 14,175 cwt.

Prussia laid down 25,870 acres in tobacco in 1863, but so late are the Returns published, that I have not been able to ascertain the amount of that year's produce.

Prussia, Baden, Bavaria, is the order of the most considerable tobacco growers in Germany.

For Bavaria specially, however, I have been able to obtain the latest Returns drawn up, namely, those of last year, 1864.

The total number of acres of land placed under cultivation in the Kingdom of Bavaria for the year 1864, was 8,835,453 Bavarian acres, of which were devoted to tobacco 16,114, yielding 125,293 cwt. of the dried leaf.

The total cultivation of tobacco in the Zollverein States amounted to in—

		Prussian Acres.	Yielding Dried Leaf.
			Cwt.
1861	..	55,885	354,335
1862	..	61,232	435,193
1863	..	84,317	682,051

Complete Returns for 1864 have not yet been made up, but I have heard their result estimated at 90,000 Prussian acres, yielding 600,000 cwt.

The fall in the amount of produce here shown, is owing to the fact that the circumstances of climate were during last year in many parts of Germany unfavourable to this special branch of cultivation.

I have already stated that no official Returns for any portion of the Zollverein are yet known for the current year 1865; but I learn from other and credible sources that the prices of South German tobacco have lately fallen very materially, and also unexpectedly, for in Baden and Bavaria the quality of this harvest has been good. But the fall is accounted for by the large stores which were still lying up from the abundant harvests of 1864 and 1863; secondly, by the European markets being once more open to the importations from America, disturbed so long by the circumstances of the American war.

Some general results, interesting perhaps to those whom this branch of inquiry may specially concern, are exhibited in the following tables, as regarding Bavaria specially:—

From a general cultivated area of 8,835,453 acres as aforesaid, in—

		Were planted with Tobacco.			Were planted with Tobacco.
		Acres.			Acres.
1856	..	15,519	1861	..	9,096
1857	..	20,179	1862	..	10,067
1858	..	17,397	1863	..	15,080
1859	..	13,934	1864	..	16,114
1860	..	11,576			

The produce was equal to in—

		Dried Leaf.			Dried Leaf.
		Cwts.			Cwts.
1856	..	126,271	1861	..	56,266
1857	..	152,975	1862	..	83,538
1858	..	132,944	1863	..	139,719
1859	..	83,980	1864	..	125,293
1860	..	84,400			

The average prices in Bavaria were in—

					Florins.
1862	14·21
1863	12·6
1864	12

The exports and imports of tobacco leaf in rolls or cigars, to and from the United Zollverein, may be given as follows for the course of the four years 1860-63 :—

IMPORTS.

		Unprepared, or Pig.	In Rolls, or Cut.	Cigars.	Snuff.
		Zoll. Cwts.	Zoll. Cwts.	Zoll. Cwts.	Zoll. Cwts.
1860	..	585,912	8,271	11,262	121
1861	..	595,917	7,507	11,432	78
1862	..	583,914	7,670	11,594	72
1863	..	572,518	7,591	12,084	57

EXPORTS.

1860	..	88,505	10,244	67,922	7,687
1861	..	131,281	10,976	14,421	8,250
1862	..	149,248	11,702	12,297	8,370
1863	..	142,861	15,082	17,193	7,701

The general export of tobacco from Germany is, therefore, far more considerable than the imports. The above remarkable fall in the export of made cigars, dates from the heavy increase of duty imposed April 1, 1861, in America, which arrested the large export till then carried on through the Netherlands' ports.

Amount of Live Stock in Bavaria.—A recent report published by the Royal Bavarian Statistical Department gives the following official return of the amount of live stock in Bavaria in the month of April 1863, comparing it with those of 1854, 1840, and 1833, and also with the live stock of various other countries of Europe :—

	1833.	1840.	1854.	1863.
Horses	333,228	349,689	347,930	380,108
Horned cattle ..	2,420,630	2,635,294	2,635,568	3,185,882
Whereof cows ..	1,162,911	1,235,519	1,349,549	1,530,526
Sheep	1,398,590	1,906,589	1,234,156	2,058,658
Swine	777,111	842,521	495,816	926,522
Goats	90,031	107,236	104,822	150,855
Beehives	135,241	213,045	202,923	233,139

Showing an increase in the last twenty-three years, or since the returns of 1840, of—

Horses	30,423	Swine	84,001
Horned cattle ..	550,588	Goats	43,619
Sheep	152,049	Beehives	20,094

The population of Bavaria amounted, according to the Census of December 3, 1861, to 4,689,837 souls; according to that of December 3, 1840, to 4,370,977; increase in the course of the twenty-three years, 318,860; and the total area of the kingdom is equal to 22,333,596 Bavarian acres, or "Tagwerke,"* or 14,974,752 Bavarian acres exclusive of forest land.

The average proportion then of live stock to the population, and to the area of the kingdom, would be as follows :—

	To every 1,000 Inhabitants.			For every 1,000 Tagwerke.		
	1840.	1852.	1861.	1840.	1852.	1861.
Horses	80	76	81	16	16	17
Horned cattle ..	603	578	679	117	118	143
Sheep	435	271	439	85	55	92
Swine	193	109	198	38	22	41
Goats	25	23	33	5	5	7
Beehives	49	45	50	10	9	10

The general decrease in the amount of live stock observable in the Returns for 1852, is to be attributed without doubt to the scarcity and high prices of grain and other articles in use for cattle feeding which prevailed about that period, consequent on unfavourable harvests.

A comparison of the live stock of Bavaria with that of some other countries of Europe, according also to official

* 100 Bavarian Tagwerke are equal to 84·199 English acres.

Returns, gives the following interesting results, maintaining as before the same standard of the population :—

	To 1,000 Inhabitants.				
	Horses.	Cattle.	Sheep.	Swine.	Beehives.
Austria, 1857	107	428	501	150	..
Prussia, 1861	91	305	943	146	..
Saxony, 1861	43	287	167	121	23
Hanover, 1857	115	489	1,012	56	110
Wurtemberg, 1861 ..	56	556	397	126	61
Baden, 1861	53	454	120	224	54
Electorate of Hesse, 1859	56	274	677	194	54
Grand Ducal Hesse, 1861	48	361	278	194	..
France, 1861	80	324	950	137	..
Belgium, 1860	63	257	143	107	..
Netherlands, 1860 ..	73	387	260	81	..
Ireland, 1861	107	626	614	220	..
Sweden, 1860	104	497	426	119	..
Bavaria, 1861	81	679	439	198	50

The information derived from the above tables may not be wholly devoid of interest when it is remembered that the amount of cattle reared in a country may be regarded as a chief criterion of the advanced state of its rural economy, and if you consider the amount of useful manure thus furnished, as well as of draft and working power (of so paramount importance in the cultivation of the soil), and also especially the amount of meat nourishment offered for consumption to the rural classes.

Bavaria then, it is seen, occupies a prominent place amongst the countries above named as regards its amount of live stock.

Cholera.—The admirable and comprehensive measures which were adopted during the course of last autumn by the Bavarian Government, with a view to arrest the progress of contagion in the event of the cholera visiting this country, will undoubtedly do good service in limiting the extension and malignity of that fearful disease, should it appear in Bavaria, and might well also serve as example for other countries.

Under the pain of severe penalties, in case of disobedience or delay in carrying out the following Ordinances—

“Every householder, and every head of a family throughout the kingdom, is ordered to inform the compe-

tent police authorities within the space of three hours of anysoever case of cholera occurring in his house or family.

“Certain *prescribed* and distinctly indicated means of *disinfection* are at once to be put into execution by order and at the cost of the householder, and to be continued in each house where a case of cholera shall have occurred, for the space of at least three weeks from the last traces of the disease—daily during the first week; every two days during the second week; every third day during the third week.

“The same prescribed process of *disinfection* to be observed in every hotel, tavern, railway station, or other places of public resort, and wherever else it may be prescribed by competent medical authorities.

“No body or bed-linen that has been in contact with a cholera patient may be mixed up with other linen soever, or given out of the house for the purpose of being washed, until it shall have gone through a certain prescribed process of disinfection by means of chloride of lime.

“The various above processes of disinfection to be executed only according to the officially prescribed methods.

“All corpses of cholera patients to be instantly removed to the various places designated by the authorities, and especially devoted to their reception.

“Should the dreadful visitation appear in the kingdom, further and still more stringent regulations to be imposed by the competent authorities in case of necessity or expediency.”

Although some individual instances of illness, at least most nearly approaching in their symptoms to Asiatic cholera, have on several occasions appeared during the last months (not, however, since the 1st of December), the whole kingdom is at this moment officially declared to be, and to have remained hitherto, wholly exempt from cholera.

In private houses the prescribed processes of disinfection were very frequently practised during the autumn months, but not compulsorily, no case of real cholera having yet occurred. In all public places, however, dependent on the Government, they were practised continually and regularly, and only ceased by Ordinance of January 1, 1866.

The substance most commonly employed in this country for the purpose of disinfection—because most easy

to obtain in adequate quantities, and cheapest—was a solution of “Eisenvitriol,” which, as far as I can learn, is a sulphate of iron, vitriol of iron, or green vitriol, in the proportions of 1 lb. of “Eisenvitriol” to 20 pints (English) of water. This vitriol in its solid state dissolves easily in tepid water, or may be liquified in a small quantity of hot water before the rest of the prescribed water is added to it cold. This solution is then thrown down the public places, and to be so used in greater or lesser quantities, and more or less frequently, according to the intensity of the contagion of cholera prevalent.

Annexed to the above Ordinances was an instruction addressed by the Home Department to all Prefects of the kingdom, or Presidents of the different circles, from which the following passages are especially worthy of notice:—

It is, first, officially declared that no great apprehensions are as yet warranted, since not a single case of real cholera has yet occurred in Bavaria, and that the present sanitary state of the capital is such as to preclude the probability of any immediate outbreak of it.

Secondly, it is declared that quarantine regulations are not contemplated against the cholera.

Lastly, the instruction says:—

“It is now generally believed that the principle or germ of cholera is only contained in the emanations from a cholera patient. Nor is it immediately that such emanations are capable of spreading contagion, but only after having passed through a process of fermentation. It is therefore this latter process which it must be our endeavour to prevent, or where it has already commenced, to counteract its baneful effects. It is principally in the ‘sulphur ammonium’ arising from such emanations (evacuations) from a cholera patient that lies the poisonous substance which contains the germ of cholera, and whose volatility spreads contagion so far and wide. Hence the double object must be borne in mind, of destroying the said ‘sulphur ammonium,’ and of counteracting the principle of the disease, which can only be obtained by the strict observance of every rule of cleanliness, and by the general employment of a process of disinfection.”

Then follow strict injunctions for the examination and supervision of the public fountains, &c.; for the prevention of the sale of quack medicines; for enforcing the observance of the laws and regulations attaching to apothecaries. To keep in each parish continually in readiness sufficient per-

sons and room for the care and lodging of cholera patients; also adequate quantities of soup and other warm articles of nourishment; and of blankets, bed and body-linen, &c., for the supply or care of the poor.

Stores of ice are especially recommended.

No cholera patient to be taken to a district hospital of which the parish is still free from the disease.

The prohibition of fairs and annual markets during the prevalence of cholera.

The Ministry of the Interior will, when necessary issue farther orders relative to the attendance at schools during the prevalence of the cholera. In no case may children belonging to districts free from the disease be permitted to attend schools in districts already infected.

In case of publication of official Returns as to the state of the disease, the amount of deaths to be named without the slightest reserve.

Cattle Plague.—The Bavarian Government have shown themselves equally vigilant and provident in the measures adopted by them against the possible introduction into this country of the murrain or “rinderpest,” which has lately caused such deplorable ravages in England.

The regulations already enforced during a short period of menaces, and ready again to be put in vigour on the slightest renewal of the danger of this contagious disease, are as follows:—

“Whoever shall contravene the regulations ordained by the police, prohibiting the importation of cattle, shall be liable to arrest, or to a fine up to 150 florins; and whoever in consequence of such contravention, shall be cause of any cattle being attacked by the cattle plague, shall be liable to imprisonment up to one year, or a fine of 400 florins (30 guineas).

“Whosoever shall neglect, or delay beyond the prescribed time, to submit sheep or other domestic animal to examination, as ordered by the police for the prevention of the spread of the sheeprot or other cattle disease, shall be liable to a fine of 10 florins.

“Whosoever, after having perceived symptoms of a contagious disease in any animal belonging to him or placed under his charge, shall not at once give notice thereof to the local police authorities, and call in the aid of a properly licensed veterinary surgeon, shall be liable to a fine of 25 florins (2 guineas).

“Should any animal show symptoms of hydrophobia it

shall be instantly killed, or rendered otherwise harmless, for default of which the foregoing penalty of 25 florins shall be inflicted."

A veterinary surgeon of high repute in Bavaria has declared, on the ground of many years' experience, muriatic acid to be an ascertained cure for the rinderpest or cattle plague.

Treatment.—Make a decoction of linseed, and administer daily, morning and evening; to oxen, 60 drops; to calves, 20 drops, of pure muriatic acid in a "quart" Bavarian, or half a pint English, of the linseed decoction.

As preventive of the disease give to the sound animals, morning and evening, water to drink mixed with pure muriatic acid in the proportions of, to full grown animals, half an ounce of muriatic acid to one eimer (Bavarian) of water; to calves, one-eighth of an ounce of muriatic acid to an eimer of water.

N.B.—The Bavarian eimer is equal to 60 Bavarian measures.

The Bavarian measure is equal to four Bavarian quarts.

The Bavarian quart is equal to somewhat less than half a pint English.

The "Trichinen" Disease.—In this already so calamitous year, a new plague has committed great ravages of late in various parts of Central Germany, namely, the "Trichinen" disease, arising from the consumption of meat or sausages, taken from diseased swine. It has been marked by great mortality, and is attended with most excruciating sufferings.

The faculty of medicine has no remedy for this disease in its more virulent form and stages. It is then almost always followed by death.

The "Trichine" is a microscopic worm, of which millions, literally millions, are generated wherever the disease has taken root, and locating themselves in the various muscles throughout the body, gradually but completely consume them. The patient dies in a state of extreme emaciation.

There is also no preventive of this disease, which, however, is not otherwise infectious than by partaking of diseased pork, but microscopic examination of the meat, and hermetic exclusion of all infected swine; or by either boiling or roasting such pork at a temperature of 60° Réaumur, which is said effectually to kill the trichine.

Vaccination.—In the year 1863-64, vaccination being

compulsory by law, there were vaccinated in Bavaria 118,857 children, with full effect; 475 children without result; whilst 4,107 children were for various causes ordered for vaccination the ensuing; and 43 were exempt from vaccination in consequence of having already had the small-pox.

In the same year 4,762 persons were re-vaccinated with effect; 3,122 without effect; 1,984 with imperfect result; 812, result unknown.

Education.—Although the system of public education and of popular primary schools established throughout the German States is so deservedly reputed, it is, perhaps, nowhere better regulated and enforced, or forms the object of more conscientious solicitude on the part of the Government than in Bavaria.

Popular or elementary schools ("Volksschuleü") are established in every parish of the kingdom, under the immediate superintendence of both the local State and communal authorities, and under the supreme direction of a Board forming part of the Ministry of the Interior or Home Department.

Both the Church and State participate in the inspection and control of the popular schools of Bavaria.

They are divided into weekly day-schools, and schools for Sundays and holidays, and attendance at them is obligatory by law on all children, male or female, from their 6th year—at the weekly schools till their 14th year, at the Sunday schools till their 16th year.

Accordingly, children may not, before the latter age, be employed at factories, or elsewhere, beyond such limit of time as shall interfere with their regular attendance at the day schools.

The fees for these schools are exceedingly moderate, and poorer children, whose parents are unable to meet even that inconsiderable demand, are educated gratuitously.

The matters taught in the popular elementary schools are religion, reading, writing, and cyphering. A limited time also is devoted almost universally to singing, and in the girls' schools to needlework.

According to the latest statistics drawn up on this subject, for the capital especially, we find that, in the course of last year, there were at Munich 41 boys' schools and 47 girls' schools, attended by 5,430 boys, and 5,800 girls—total, 11,230 children; being an increase of 447 on

the preceding twelvemonth, and to which belonged 68 teachers, 69 female teachers, and 52 teachers of needlework.

The period prescribed for school attendance is weekly twenty hours, to which may be added, also weekly, for girls, eight hours for learning needlework, and for both boys and girls two or three hours for singing.

In some of the schools drawing is also taught, but neither of the latter three classes is obligatory. There are also schools for drawing especially.

Further, Munich may boast also of trade and apprentice schools, in which are taught according to the requirements of the two above categories, arithmetic and geometry, technological chemistry, descriptive geometry, knowledge of machinery, drawing, modelling, &c.

For the higher orders of education, Bavaria has three Universities,—those of Munich and Würzburg (Catholic), and Erlangen (Protestant); also numerous lyceums, gymnasiums, grammar schools, and seminaries for the education of teachers.

The number of students at the Munich University matriculated for last winter was 1,061 Bavarians, 200 foreigners, total, 1,261; having a library of 147,541 vols. and 5,294 MSS. At Würzburg, 414 Bavarians, 204 foreigners, total, 618, having a library of 100,000 vols. At Erlangen, 318 Bavarians, 155 foreigners, total 473, having a library of 140,000 vols. Total at the three Universities, 2,352 students; volumes at their disposal, 387,541.

Munich has, further, a Royal Academy of Fine Arts, an Academy of Arts and Sciences, Royal Conservatory of Music, a School of Agriculture, a Veterinary School, a School for the Cultivation of Forests, the Maximilianeum, the Royal Page Corps, the Cadet Corps, a Military School, a School of Medicine, a School of Pharmacy, Polytechnic School, the Blind Institute, the Deaf and Dumb Institute, zoological, mineralogical, and anatomical collections; the State Library, with a most numerous and valuable collection of works—22,000 MSS. and 800,000 volumes.

The capital of each circle has, further, a library open to the student and public on the easiest terms, thus forming a total of volumes in the public State Libraries of circa 2,000,000 volumes.

For the whole kingdom the total number of primary schools at the last returns was 7,113, with 946,275 scholars, and 8,937 teachers.

German Railways.—The detailed Tables of the railway traffic not being yet completed for last year for each State individually, I can here give only partial Returns to show that the traffic throughout Germany is continually and largely increasing.

Thus, if we take the common Returns of the five principal Railway Unions of Germany for the year 1864 we find :—

NORTH GERMAN UNION.				Receipts.
				Thalers.*
On traffic of passengers	1,809,475
Increase on 1863	110,946
On traffic of merchandise	6,438,627
Increase on 1863	1,314,602
CENTRAL GERMAN UNION.				
On traffic of passengers	799,078
Increase on 1863	24,072
On traffic of merchandise	1,795,902
Increase on 1863	82,709
RHENISH-THURINGIAN UNION.				
On traffic of passengers	178,011
Increase on 1863	22,840
On traffic of merchandise	1,449,151
Increase on 1863	177,296
WEST GERMAN UNION.				
On traffic of passengers	220,268
Increase on 1863	7,091
On traffic of merchandise	415,295
Increase on 1863	56,195
HANOVERIAN-BAVARIAN-AUSTRIAN UNION.				
On traffic of passengers	14,466
Decrease on 1863	1,838
On traffic of merchandise	311,600
Increase on 1863	139,325
WESTPHALIAN UNION. (Opened April 1, 1863.)				
On traffic of passengers	127,440
On traffic of merchandise	1,543,018
SOUTH GERMAN UNION. (Opened July 1, 1863.)				
On traffic of merchandise	1,140,354

The above figures apply only to such portions of the total receipts of the German railways as belong in common to the members of each Union.

The official Returns of the Bavarian railways specially have not yet appeared.

* Equal to 3s.

Navigation of the Rhine.—The transport of merchandize by the watercourse of the Rhine is daily decreasing, and being superseded by the railway traffic on its banks.

Although not less a sum than 6,600,222 francs was expended in the year 1864, in the following proportions :—

	Francs.		Francs.
Netherlands	3,436,639	Nassau	116,538
Baden	1,071,532	Hesse	88,281
France	866,000	Bavaria	267,353
Prussia	753,878		

on the rectification and improvement of the river, yet we find the receipts of the navigation tolls to have amounted to only 1,192,377 francs in 1864, against 1,369,533 francs in 1863 ; being a decrease of 177,155 francs.

The number of vessels registered at Coblentz, one of the principal stations, was in 1862, 2,796 ; 1863, 2,577 ; 1864, 2,411 ; whilst the amount of goods conveyed diminished by 1,500,000 cwts.

At Mayence also the decrease was equal to 2,000,000 cwts.

The total traffic amounted to—

	Merchandise.	Passengers by the Cologne and Dusseldorf Company.
	Cwts.	
1862	32,380,986	1,028,697
1863	30,913,617	1,072,710
1864	27,070,333	955,767

But the amount of coal conveyed to the Rhine from Ruhrort and Duisburg equalled in 1863, 32,000,000 cwts. ; in 1864, 34,000,000 cwts.

The traffic on the Bavarian-Ludwigs (or Maine and Danube) Canal is likewise continually diminishing. The year 1864—an exceptional year too—numbered 299 vessels less than 1863 ; and the transport of merchandize, with a total of 3,315,262 cwt., suffered a decrease of 331,324 cwt.

With the exception of the conveyance of corn, meat, wood, stones, and such articles, the traffic in all other goods by this canal has materially fallen off.

The special Bavarian returns of this inland navigation

show, for the flourishing river port of Ludwigshafen, a traffic of 2,250 vessels to and fro, carrying 2,413,446 cwt. of goods, in the year 1864 ; and Speyer, 37,457 cwt.

Mines.—The last published official Returns of the produce of the mines, iron, and salt works of the Zollverein, exhibit the following results for the year 1863 :—

Total number of active mines and works	6,322
Total number of workmen employed	276,001
Total amount of produce, raw and prepared	551,575,810 cwt.
Increase upon 1862	37,325,087 ..

MINES.

Coal—

Number of works	671
Produce	338,134,152 cwts.
Value	28,489,553 thalers.
Workmen employed	90,561

Lignite—

Number of works	843
Produce	109,189,899 cwts.
Value	5,061,241 thalers.
Workmen employed	20,060

IRON WORKS.

Iron ore—

Number of works	2,018
Produce	47,494,909 cwts.
Value	3,915,992 thalers.
Workmen employed	23,540

Raw iron—

Number of works	307
Produce	14,611,477 cwts.
Value	18,880,530 thalers.
Workmen employed	15,307

Raw steel—

Number of works	6
Produce	447,969 cwts.
Value	817,525 thalers.
Workmen employed	136

Ware, cast from ore—

Number of works	40
Produce	1,191,661 cwts.
Value	3,614,026 thalers.
Workmen employed	5,632

Ware, cast from iron—

Number of works	339
Produce	3,363,809 cwts.
Value	12,414,413 thalers.
Workmen employed	17,230

Bar and rolled iron—

Iron wire—

Number of works	159
Produce	633,638 cwts.
Value	2,971,949 thalers.
Workmen	2,587

Steel—

Number of works	177
Produce	1,805,009 cwts.
Value	7,733,613 thalers.
Workmen employed	9,482

Further—

Gold and silver ore	694,288½ cwts.
Quicksilver	55 ”
Lead ore	3,216,948 ”
Copper ore	2,811,586 ”
Zinc ore	5,833,864 ”
Tin ore	4,273 ”
Cobalt ore	35,775 ”
Arsenic ore	39,290 ”
Antimony ore	5,247 ”
Manganese ore	364,847 ”
Alum ore	340,007 ”
Vitriol ore	792,263 ”
Graphite	16,077 ”
Asphalt	10,300 ”
Fluor spar (“ fluss-spath ”)	105,534 ”

Lastly—

SALTWORKS.

Produce—

Rock-salt	2,712,509 cwts.
Culinary salt	5,560,120 ”
Black and yellow salt	183,982 ”
Salt for manure	144,491 ”
Total	8,601,102
Number of works	90
Value	6,139,222 thalers.
Workmen employed	6,148

With a total produce, then, from mines, iron, and salt works, of 551,575,810 cwt., giving continual and unvarying employment to a population of 276,001 men, and these proportions annually increasing, Germany may well be thankful for her mineral riches.

Bavaria, specially, with her extensive and well-conducted salt-works, yields a good proportion of the above consider-

able produce, but the special Returns for Bavaria are not yet drawn up.

The consumption of coal in particular is so constantly and largely increasing throughout Germany for the service of the ironworks and numerous manufactories, that even the rich veins of Prussia can hardly meet the demand, and much discontent and ill-will towards the latter State has been caused, in consequence, by her recent contract with France for supply of coals from the mines of Saarbruck, which also has been the more distasteful from being deemed a political as well as commercial concession.

After Great Britain, the German Zollverein is, of all countries, the most considerable producer of coal, and yielded in the year 1863, as already shown, circa 447,500,000 cwt., and in the following proportions, as regards the several States of the Customs and Commercial Union, who are fortunate enough to possess that mineral.

The principal ones are as follows :—

Prussia, circa	366,000,000 cwt.
Saxony "	46,000,000 "
Anhalt "	8,000,000 "
Hanover "	6,000,000 "
Bavaria "	5,000,000 "
Hesse "	5,000,000 "
Altenburg "	3,000,000 "

But the coal of Germany is usually of a description far inferior to that of England. It is mostly to be classed among the "lignites," the so-called "steinkohlen" of Germany being only of a better, and the "braunkohlen" of an inferior quality, of that denomination.

Population.—The population of Bavaria, of which the census is taken, as in every other State member of the Zollverein, on the 3rd of December every third year, shows for that of 1864 a larger increase than during any former triennial period since 1834.

The following figures exhibit the result for the whole kingdom, and also for the capital specially, of the census of December 3, 1864, compared with the last preceding one of 1861 :—

	1861.	1864.
Total population of the Kingdom ..	4,689,837	4,807,440 Including 118,082 military and their families.
„ „ Munich ..	148,201	167,054 Including 23,738 military class and their families.

The large increase of the population of Bavaria since 1858 is in a great measure to be ascribed to the salutary effects which have been produced on the general condition and comforts of the people by the abolition or reduction of many as unwise as illiberal restrictions, which till then had attached to the establishment in domicile or trade in this country, and to the obtaining of the prescribed marriage licenses. Whilst under milder regulations also the disposition to emigrate has naturally decreased, the inducement to immigration, to settling, and to establishment in business, has proportionately increased.

But the above so desirable alteration in the laws has also been productive of a striking improvement, almost unparalleled considering the shortness of the period, in the moral habits of the people. The vexatious police and communal licenses, not always easy to obtain, which had hitherto been required to enable parties to contract marriage, had been undoubtedly the cause of, as they at the same time greatly excused, Bavaria counting a larger proportion of illegitimate births than almost any other country in Europe; and it is indeed manifest that such restrictive regulations must have been productive of many improvident unions. These illegitimate births accordingly have frequently been stated at a common average of 20 or 25 per cent. of the whole population of Bavaria, whilst in the capital specially they have been declared in some years to have exceeded the number of children born in wedlock.

Unfortunately, although the above may at one time have been correct as a general average, the minute statistical researches lately given to the public by the renowned Dr. F. B. von Hermann, of Munich, state positively the average of illegitimate births in Bavaria during the last thirty years to have been, in the seven circles this side the Rhine, equal to one-third of the whole, or 33 in 100, though in the Province of the Rhine Palatinate only one-

tenth, or 10 in 100, whilst the proportion of natural-born children, afterwards legitimated, was as 1 to 3·3 in the Palatinate, and 1 to 9·3 in the other provinces of the kingdom.

Yet in the seven circles of the kingdom, exclusive of the Palatinate, the triennial census period 1858-61 showed already an increase of 12,000, and the period 1861-64 of 16,000 in the general number of marriages.

For the capital specially, during the space between 1834 and 1858, the mean number of marriages contracted during a triennial period amounted only to 1,614. In the period 1858-61 they had increased to an average of 3,172, and in that of 1861-64 to 4,630.

The number of births had been on an average from 1834 to 1864 in the above seven circles, 407,385 per triennial period. In the period 1858-61 they had increased by 22,640, and in 1861-64 by 53,356.

Previous to 1858 also the mean number of marriages contracted in after life with a view of legitimating children born out of wedlock, was reckoned at as one to eight; in the period 1858-61 it was one in seven; in 1861-64 one in six.

Lastly, whilst during the triennial period of 1861-64 the proportion of illegitimate births in Bavaria as compared to those in wedlock, has considerably decreased, the number of legitimations of natural-born children has greatly augmented. Dr. Hermann states, that whilst the general average of such legitimations was 14,643 for every triennial period between 1834 and 1864, it increased in the period 1858-61 to 18,589, and in that of 1861-64 to 24,466.

Such, then, is the number of persons who, under the milder Government of to-day have been relieved from the stigma of illegitimacy, which under the circumstances and regulations formerly obtaining would have been allowed by their parents to rest upon them for life.

So great and beneficial results may, it is to be hoped, conduce to a further extension of such better rule, and in this direction very much may yet be done in Bavaria for the improvement, and moral as well as economical culture of the people.

The very marked difference observable throughout these statistics on the movements of the population, between the seven circles of the kingdom situate on the right bank of the Rhine and the single province on the

left bank of the Rhine Palatinate, is to be traced to a variety of causes.

In the statistics of births and deaths it may in some degree be ascribed to the differences of climate; but in those relative to the number of marriages, of illegitimate births, of immigration and emigration, it is to be attributed to the difference in the laws. Marriage, as well as freedom in domicile, establishment, and trade, are unfettered in the Code Napoleon, which still obtains unimpaired in that single province of Bavaria.

In every respect, indeed, the difference found in the statistics of the Palatinate, as compared to the rest of Bavaria, is, as we shall again see further on, remarkable, so widely different are the circumstances of that circle.

Thus the excess of births over deaths returned for that Province is as follows, taking the annual average for the last thirty years, 1834-64.

Upon every 1,000 of the total population of the Kingdom—

	Births.	Deaths.	Excess of Births.
In the Palatinate	38·2	25·9	12·3
This side the Rhine	34·7	29·8	5·1
Total of the Kingdom ..	35·1	29·1	6·0

And this is in great measure to be ascribed to the circumstances of climate, which cause a notably lesser number of deaths among children in the Palatinate than in the other Bavarian provinces or circles.

In the Palatinate the average is one marriage to every 138 of the inhabitants, whilst in the rest of the kingdom it is as 1 to 162.

As regards the statistics of age, the overweening proportion of persons under fourteen years of age is very remarkable as compared to those over that age, for whilst in the total population of the kingdom the average of the former is as 393 under 14 to 1,000 over that age, in the Palatinate alone it is computed at 512.

Here again the better life of children in the Palatinate is a principal cause, but also to a great degree the amount of continual emigration from that province must be considered, for that is large, and is necessarily recruited chiefly among the adult and able-bodied persons.

The total of the population of Bavaria, according to the last census (December 3, 1864) is computed and subdivided as follows :—

Civilian class—				
Male..	2,267,694
Female	2,421,664
				<hr/> 4,689,358
Military class and their families—				
Male..	113,479
Female	4,603
				<hr/> 118,082
Grand total ..				<hr/> 4,807,440
Of whom 3,477,469 over 14 years of age.				
1,329,971 under ..				

But no statistics are so difficult to return with correctness as those concerning the movements of a population ; and often do inferences drawn at first sight from the most authentic figures prove erroneous. Thus the first inference which would suggest itself on perusing the above average excess of births over deaths in the Palatinate would ascribe much more than is really due to the better influence of climate in that province. Yet I have just shown that the greater emigration of adults from thence is no inconsiderable cause of that circumstance.

Emigration from the Bavarian Palatinate has at all times been great. The province is overpeopled ; its inhabitants are of a more active and enterprising race ; and the slightest rise in the price of the necessaries of life, or disturbance in the amount of employment offered them, will drive whole masses at a time from the densely-stocked Palatinate towns, to seek sustenance and work far from their native homes.

Emigration.—On the whole it would appear from authentic Returns of the principal German States, that the emigration to the New World from the poor lands or overpopulated districts of Germany is again diminishing.

The Emigrant Office of Bremen, which is perhaps the most active in Germany, shows the emigration from that port alone to have amounted in the course of thirty years, or from 1832 to 1862, to 793,267 souls ; being an average per year of 25,589. The year 1862, however, counted only 15,087 emigrants, showing a notable decrease.

Of the numerous emigrants during the last ten years from the seaport of Bremen, 56 per cent. are said to have sailed for New York ; 19 per cent. for Baltimore ; 18 per

cent. for New Orleans ; 3 per cent. for Galveston ; 1 per cent. for Charleston, Quebec, and other foreign ports. By far the greater number of these sailed under the Bremen flag.

The most considerable number of emigrants *via* Bremen left the shores of Europe in the year 1854, when there sailed from that port alone 76,875 souls ; in 1852, 58,551 ; in 1853, 58,111.

The arrangements made by the Emigrant Office of Bremen for the comfort and safety of these poor exiles are said to be especially good, and from all parts of Germany the wanderers flock to that port.

Whilst the Bremen returns, however, show for the year 1862 a diminution of German emigration, those of Hamburg, again, present a different result, and at the latter place 19,883 persons are shown to have embarked for the New World during the course of 1862, against 14,649 in 1861, and 13,012 in 1860.

The total number of persons who are *known* to have emigrated from Bavaria specially during the sixteen years between 1835 and 1851 was 132,788, or an average of 8,293 annually ; but 1852 proved an exceptional year, and, in consequence of the general rise in the cost of the first necessities of life during the triennial period 1852-55, it is computed that not less than 25,455 persons left the kingdom of Bavaria in that short period alone, whilst the tide of emigration has decreased for the period 1862-64 to 9,963.

The total emigration from Bavaria during the thirty years comprising 1834-64 amounted to 258,668.

It has been abundantly proved that it is not always an absolute over-population which is cause of the constant emigration to the New World from the plains of Germany, but that it is in great measure the regulations still attaching in many parts to trade, the hampering individuals in their establishment in life, and the enactments and restrictions that beset marriage, the acquisition of property, &c., &c., that drive people to relinquish their native country, seeking to better their condition and comforts in foreign lands and under sounder foreign legislation.

Emigration from Bavaria, where happily much has been done to alleviate the above evils, is now less frequent. Under the mild and equitable rule of this country, the people are generally contented, and remain proverbially, as all people of a mountainous region, attached to their

native land. Their generally simple and frugal habits, too, ward off the greater vicissitudes of life, whilst the considerable and fertile agricultural area of Bavaria, and the now continually-increasing industrial and manufacturing activity throughout the kingdom have afforded of late years a sufficiency of employment at good wages. In consequence, the large emigration of former years from the Rhine Palatinate has also of late diminished.

A new stream of emigration, however, has set in since the close of the American war. The laborious German is leaving his native country in large numbers to seek the abundant employment which the abolition of slavery in America must necessarily offer; and although official Returns have not yet verified the total amount of emigration of the past year, it is known to have been very great, and bound this time almost exclusively to America.

The neighbouring state of Wurtemberg, and especially the Black Forest, have lost of late a great number of young and able-bodied men and women.

I am informed that between the 1st of January and the 31st of December, 1865, 44,181 emigrants, in 128 vessels, left the port of Bremen, against 27,486 persons and 88 vessels in 1864, and 18,022 persons and 85 vessels in 1863.

Of the emigrants of 1865, 38,676 embarked direct for New York; 4,749 for Baltimore; 6,666 for New Orleans; 61 for Galveston; 19 for Buenos Ayres.

From Hamburgh there sailed in 1865 94 vessels, with 36,878 emigrants, against 19,747 in 1864, and 21,886 in 1863.

A general survey of the emigration *via* Bremen for the last thirteen years shows for 1853—

	Vessels.	Emigrants.		Vessels.	Emigrants.
1853	288	58,111	1860	162	30,240
1854	362	76,875	1861	100	16,469
1855	165	31,477	1862	90	15,087
1856	185	36,483	1863	85	18,022
1857	220	49,399	1864	88	27,486
1858	143	23,109	1865	128	44,181
1859	128	21,947			

Many of the vessels employed in this traffic are now steamers, which afford a great additional comfort to the poor emigrants by shortening the period of their voyage and sufferings.

Criminal Statistics.—The last Report published by the Bavarian Ministry of Justice comprises the judicial statistics of the kingdom for the four years 1857–58 to 1860–61.

Instead, however, of transcribing here a separate return of the convictions, acquittals, penalties, &c., belonging to each of the above years, I will give the average annual amount for the whole period, only comparing such results with some foregoing returns.

A marked difference being always observable between the amount and nature of the crimes and misdemeanours committed in the province of the Rhine Palatinate as compared with the seven circles of Bavaria situate on the right bank of the Rhine, and arising from the difference in the laws, as well as the general condition of the people in those two portions of the kingdom, I must remark that the next following Tables apply only to the seven circles of Bavaria proper, and the Returns for the Palatinate shall be treated in juxtaposition subsequently.

The Seven Circles "this side the Rhine."—The number of judicial proceedings definitively adjudicated by juries or district courts averaged during the 4 years 1857–61, 6,375 per year, of which 5,421 crimes or misdemeanours against private persons, and 954 of a more public character, and during the same period also an average of 6,210 judgments were pronounced annually, of which 255 by the jury, and 5,955 by the smaller courts.

In the years 1858–59 and 1860–61 the number of cases was below the above average, for in those two years it was 6,024 cases and 6,022 judgments, whilst in 1857–58 and 1859–60 the numbers were 6,467 and 6,328.

Of the 6,210 judgments pronounced per annual average in the above 4 years, 563 were acquittals; 5,647 sentences to punishment, so that the average may again be stated at circa 10 convictions to 1 acquittal.

The proportion of the acquittals to the convictions is also before the assizes as 1 to 6·2; before the borough and district courts 1 to 10·6.

Further, among the aforesaid 6,210 judgments, 5,915 were for the commission or originating of the offence; 89 for aiding and abetting; 206 for connivance.

Of the 5,647 convictions and sentences to punishment, as above stated, 1,437 were for criminal offences, of which 22 sentences to death; 8 to hard labour in chains; 95 to house of correction; 1,305 to penitentiaries or imprison-

ment in a fortress; 6 to dismissal from employment; and 4,210 to various minor penalties of misdemeanour.

In the same period there were in each 100 convictions:

Men	83·39	Married	24·22
Women	16·61	Roman Catholics ..	80·17
Under 16 years of age	2·28	Protestants	19·21
Between 16 and 60 ..	95·02	Of other professions of faith	0·62
Over 60	2·70	Of legitimate birth ..	80·61
Unmarried persons ..	75·78	Illegitimate born ..	19·39

In the same period of 4 years 17 persons were executed, making an annual average of 4 capital punishments for murder, or the worst class of robbery with violence causing death.

In proportion to heads of the population the average during the four years was:—

One conviction for criminal offences to every 715 inhabitants.

One sentence to death, hard labour in chains, or house of correction to every 31,917 inhabitants.

One sentence to the penitentiary to every 3,098 inhabitants.

One sentence for misdemeanour to every 959 inhabitants.

But the average for the 4 years 1857–58 to 1860–61 shows to every 207 inhabitants one indictable offence giving rise to judicial proceedings, whilst in the 4 years 1851–54 it was one such offence to every 191 inhabitants, and in 1854–59 one to every 199.

On the whole, then, a decrease is observable in Bavaria in the worst order of crimes, and in the period of years 1857–61 there was a notable diminution in the number of crimes directed against the person, whilst there was an increase of offences against property.

The peculiar nature of the offences giving rise in 1857–61 to the annual average of 6,375 judicial proceedings aforesaid, was as follows:—

- 125 crimes or offences against the person, such as murder, homicide, aggravated assaults, and death caused by negligence.
- 1,566 injury to the person, as ill-treatment, &c.
- 2,925 offences against property, as robbery, theft, fraudulency, &c.
- 148 injury to property, as arson, &c.
- 657 offences against private rights, as imposture, fraud, &c.
- 0·7 offences against the security of the State.
- 19 offences against Majesty.
- 529 offences against the authorities.
- 171 offences against public rights.
- 32 offences against religion.
- 13 offences against public property, as injury to the telegraphs, &c.

180 offences on the part of public or State officials (of which 145 bribery and corruption).
9 offences of the press.

The judicial proceedings in matter connected with offences of the press, inclusive of mere transgression of police regulations, averaged in the years 1857-61 145 cases annually, of which 85 were dismissed; 28 summarily disposed of by the police magistrates; 27 referred to courts of appeal, of which again 18 were dismissed, and 9 sent before the jury; 5 disposed of by other authorities.

This average shows for every three cases one sentence, if not against the person, at least against the publication.

The following comparison with the Returns of two preceding periods exhibits the movements of crime observable in the seven circles of the kingdom this side the Rhine during the last ten years:—

	1850-54.	1854-57.	1857-61.
Total number of convictions ..	19,554	17,699	22,589
In every 100 persons convicted were—			
Men	82	79	83·39
Women	18	21	16·61
Under 16 years of age ..	2	2·9	2·28
Between 16 and 60 ..	95·5	94·5	95·02
Over 60 years of age ..	2·5	2·6	2·70
Unmarried	74·9	74·1	75·78
Married	25·1	25·9	24·2
Roman Catholics	79·7	80·17
Protestants	19·7	19·21
Of other persuasions	0·6	0·62
Of legitimate birth	82	80·61
Illegitimate born	18	19·39
Showing also an average of—			
One conviction for crime or misdemeanour to every ..	Inhabitants. 804	Inhabitants. 670	Inhabitants. 715
One conviction for crimes liable to penalty of death, hard labour in chains, or house of correction	15,712	21,720	31,917
One conviction for crimes liable to penalty of the penitentiary.	2,881	2,545	3,098
One conviction for misdemeanour	1,149	953	959
Total number of proceedings against the press	980	538	579
Of which sent to the assizes ..	47	25	35

The Rhine Palatinate.—In the province of Palatinate, or “the left bank of the Rhine,” with a population counting,

according to the census of December 3, 1861, 608,059 souls, the judicial statistics for the period of 4 years 1857-61, show an average of 40 convictions for crimes; 2,153 for misdemeanours, or

One conviction on account of crimes to every 15,044 inhabitants.

One conviction on account of misdemeanours to every 279 inhabitants.

One conviction generally for either class of offence to every 274 inhabitants.

Further, 14 persons were condemned to death during these 4 years, though the penalty was carried out in only one instance, namely, for murder, the remainder having been commuted to hard labour in chains, &c.

	1850-54.	1854-57.	1857-61.
	Inhabitants.	Inhabitants.	Inhabitants.
There was an average of—			
One conviction for crimes to every	15,250	17,226	21,166
One conviction for misdemeanour to every	162	177	242
One conviction for contravention of mere police regulations to every	13	13·5	14·2

In the Province of the Rhine Palatinate also, therefore, it is satisfactory to find a diminution of indictable offences.

Patents.—At a moment when the question is everywhere under so lively discussion how far protective duties should be afforded to native industry, and doubts are expressed whether even inventions should enjoy any longer the privilege of the Patent, it may not be without interest to note the appreciation of these questions in Germany, and to state the number of patents now on an average annually issued within the limits of the Zollverein, or German Customs' Union.

In the year 1863 the various States of the Zollverein issued, according to official Returns, 637 patents, of which the greatest number, or 176, were granted in Saxony; 91 in Bavaria; 85 in Wurtemberg; 71 in Prussia.

However, 637 is not the precise number of new inventions registered, but 448; for in many cases the inventors took out patents in various different States of the Zollverein at the same time.

Of the above 448 new inventions, 256 belong to the branch of machinery; and of these 256 again, 97 relate exclusively to spinning, weaving, preparations of stuffs, &c.;

109 relate to agriculture ; 69 to the preparation of chemical products, colours, photographic processes, &c. ; 5 to the manufacture of sugar ; 21 to improvements in firearms.

But so far behind is the industrial intelligency of Germany, and above all the spirit of enterprize and improvement, that of at the least one-third of the cases here referred to it might conscientiously be asserted that the inventions have hardly paid the amount of the patent fees, and were not worthy to aspire to any privilege soever.

Weights and Measures.—The desire which for many years has been so loudly expressed and strongly supported by the public press throughout Germany, to see one uniform system of weights and measures introduced in all States of the Confederation, would seem at last to be near its realisation.

On the 23rd of February, 1860, a proposition to the above affect was brought before the Federal Diet at Frankfort, by Bavaria, Saxony, Wurtemberg, the two Hesses, Nassau, Meiningen, and Altenburg, collectively, and on the 28th of June of the same year, a special Federal Commission was appointed to deliberate and report upon the question, which held its first sitting accordingly at Frankfort, January 12, 1861, whilst in the meantime several other States of Germany, as also Austria, had adhered to the project.

The absolute necessity of some comprehensive reform in the above sense, of the present vexatious state of things, in an union of States so intimately connected in commerce, trade, and intercourse, as are those of the Germanic Confederation, will be best understood when I state that at this moment more than thirty different systems of weights, measures, or money, are in force in Germany, and that, under every variety of denomination, whole volumes would be required to contain the numerous acts, and describe correctly the divers matters connected with them.

It would be difficult to pourtray all the inconveniences, controversies, difficulties, and loss of time, which in every transaction are at present entailed on the trading communities by this custom, so prejudicial too to the unity of Germany, which is the general aspiration of the nation.

As it became manifest to all rational persons that the establishment anew in Germany, occupying the vast centre of Europe, of a system of weights and measures differing widely, or even at all, from those adopted in the other large centres of commerce and business, would be unwise,

the first question for the consideration of the Commission was, whether the system current in Great Britain, or that of France (already common to several other States of Europe), should have the preference.

The circumstance, however, of the ever increasing leaning even in England towards an abandonment of our current system, and its assimilation to the more simple, metrical and decimal one of France, ultimately prevailed with the Transport Board, and on the 1st of December, 1865, their Report was drawn up, whose fundamental propositions may be briefly stated as follows :—

“The basis of weights and measures is the ‘metre,’ namely, the ‘mètre des Archives de Paris,’ at the temperature of molten iron.

“*Long Measure.*—The metre with its known decimal subdivisions.

“*Square Measure.*—The square metre. .

For surface or area the “are,” namely, decametre square, or 100 square metres.

“*Cube Measure.*—The cubic metre.

“*Liquid Measure.*—The ‘litre,’ or cubic decametre.

“For weights, the ‘gramme’ is proposed to be taken as base or unit.

“Five hundred grammes, or half a kilogramme, equal to one pound.

“The ‘centner,’ (French quintal) to be equal to 100 lbs. or 50 kilogrammes.

“The ‘last’ equal 4,000 lbs., or 2,000 kilogrammes.”

All further more minute details of the decimal and metrical system are too apparent and well known to require to be repeated here.

Abolition of Passports.—By a Convention signed during the course of last year between the Governments of Bavaria, Hanover, Wurtemberg, and Saxony, and to which those of Baden and Oldenburg have since adhered, the formality of passports is henceforth abolished in those several States.

The first Article of the above Treaty says :—

Art. I. Travellers are henceforward exempt, on entering as well as leaving any of the States of this Union, from the necessity of bearing passports.

Art. II. The traveller, however, may be called upon by the competent authorities to give his name and habitual address, and, according to circumstances, to furnish also evidence of his possessing sufficient means of subsistence during his stay in the country.

Art. XIII. Maintains the right of each State of this Union to re-establish the passport system, temporarily or otherwise, in case of war, popular disturbances, &c. &c.

Art. XIV. Gives the right to each State party to this Convention to withdraw from its engagements after a year's notification.

Art. XV. Provides to all other States of the German Confederation the faculty to adhere to this Treaty and become members of the Union.

The stipulations of the above Convention came into force January 1, 1866.

Finances and State of Public Debt and Credit.

The eighth financial period of Bavaria, comprising the six years 1861-67, has still a third of its course to run.

My former Reports have already fully detailed the state of the public debt in all its various branches, tracing it step by step from its earliest origin, and so little embarrassed are the finances of this country, and regular their administration, that no important movements have to be recorded regarding them during late years.

One only circumstance, of considerable moment as regards the future, has to be stated, namely, the curtailing the financial period henceforth to three years, instead of six as hitherto. This wise reform had been long and loudly called for, and for a length of time had formed the subject each year of at times angry discussion in the Bavarian Diet, and of complaint against the Government.

One of the first acts of the reigning Sovereign, King Louis II., was to accede to the desire of his Chambers, and in their session of last year it at length became law that thenceforth no budget should be voted for longer than a triennial period.

The following figures give the estimates of revenue and expenditure voted, after much hesitation and debate, in the autumn of 1861, for the eighth financial period, the last of six year's duration, which is still in force, and will obtain till October 1st, 1857.

Public Funded Debt.

The total amount of the Bavarian Municipal and Rural Communal Debt was, at the close of the year 1862-63, 15,316,636 florins 50½ kreutzers.

(Signed) A. G. G. BONAR.

Hanover.

*Report by Mr. Doria, Her Majesty's Secretary of Legation,
on the Harbour of Geestemunde.*

Hanover, January 1866.

BEING led to suppose that the harbour of Geestemunde, which has been constructed by the Hanoverian Government, and which was opened on the 21st of July, 1863, remains comparatively but little known, and that the said port is possessed of many advantages, at the same time that the harbour dues levied on vessel is proportionately low, I have chosen it for the subject of my half-yearly Report. Another reason for my selecting it as a subject to report on, is my having observed that even in some of the most recently published maps the Harbour of Geestemunde is not laid down.

The accompanying plan of the harbour points out that portion of the port and buildings which are "free," and not included within the Zollverein territory; it shows also its relative position to its rival, Bremerhafen, with which it is situated in such immediate proximity.

The three German rivers, Elbe, Weser, and Ems, which flow into the North Sea, not only have their course through the Kingdom of Hanover, but also their embouchures are on the Hanoverian Coast, and they cease to become navigable for sea ships within the Hanoverian territory.

Notwithstanding the advantage to which such favourable circumstances might be turned, Hanover has not established any transatlantic commercial relations of any importance, nor has her commerce much increased even with more neighbouring States. The reasons for this almost total absence of commercial enterprise exist in a great measure, even at the present day. Hanover, like most of the German States, has confined her attention more particularly to agriculture; nor did she belong to the German Customs' Union till the year 1854.

The produce of Hanover, viz., corn and cattle, did not

find favourable markets in other countries where, till recently, taxes on their importation used to be levied, the consequence was that no large quantity of produce destined for exportation was raised in Hanover. Another cause of the insignificance of Hanoverian commerce is to be found in the flourishing state of her two great rivals, the free towns of Bremen and Hamburg, which for a long series of years have attracted to themselves the commerce of the North of Germany, owing to the wealth, intelligence, and their extended mercantile connection with the whole world.

Circumstances are, however, somewhat altered to a more favourable state. Hanover, although especially an agricultural country by her connection with the Zollverein States, which she joined in 1854, has obtained a protection for the establishment of manufactures, the increasing consumption of which, by her own population, is of the greatest importance to her, and has also lead to the fact of her constructing within her own territory the rival port of Geestemunde to that of Bremerhafen, belonging to Bremen. Whether the Port of Geestemunde, however, will ever rise to that state to become a successful rival to the Port of Bremerhafen remains to be seen, which is thought to be unlikely if not impossible.

It is not, however, undeserving the attention of other nations, that at Geestemunde a port has been constructed, the advantages of which may become of consequence. Austria has already availed herself of this harbour. In 1864, three men-of-war belonging to her navy, were for a long time stationed there—the “Kaiser,” the “Max,” and “Friederick”—which proves that the harbour is capable of containing vessels of considerable size, and drawing many feet of water.

The port is protected by solid embankments, and affords perfectly safe and convenient shelter for ships, which can run in and out when the Elbe and the Ems are full of ice, and therefore shut to shipping. The reason is that a very low temperature is generally accompanied by east wind, which drives the ice from the eastern shore on which Geestemunde is situated.

The railway terminus from Bremen is in connection with the warehouses, and is consequently in direct communication with the railway system of the whole of Germany.

The port, including warehouses and the greater part of the railway station, as also the “Place” of Geestemunde, is not included in the territory of the Zollverein, but is a

free port in which neither import or export duties are levied, but goods are subjected to the supervision of the Custom-house authorities when intended to be sent into the Zollverein.

The large harbour basin is 1,734 feet long, and 400 feet broad. Its projected depth of water is $26\frac{1}{2}$ Hanoverian feet, equal to $25\frac{1}{2}$ feet English. When opened on the 21st of July, 1863, the harbour had not attained that depth, and was only accessible to ships of 22 feet Hanoverian draught. Since that time the depth in the eastern side has reached 26 feet, Hanoverian measure; on the western side of the harbour 22 feet. The work will be continued until a depth of $26\frac{1}{2}$ feet has been obtained. The sluice by which entrance is obtained to the harbour basin is constructed on the principle of a chamberlock, with iron flood and ebb gates, so that ships can run in and out at almost any time during the twenty-four hours, and are not restricted to a short time before and after high water. The lock has a clear breadth of 80 Hanoverian feet, ($76\frac{1}{2}$ English feet), and the chamber a length of 250 Hanoverian feet, equal to $239\frac{1}{2}$ English feet. Ships, therefore, of 230 Hanoverian feet in length (220 feet English), can use the sluice as a chamber-lock, and ships of greater length, during the time the flood-gates are open, can pass in and out, that is, at high water.

To connect the harbour with the railway station a bridge has been constructed over the main canal; it is constructed as a swing bridge, and as such, has two openings each of a clear width of 63 Hanoverian feet. The canals are furnished with quays of brick and stone work in the same manner as the harbour basin, comprising in all a length of 6,000 feet. The rails are on the same level as the quays, and are brought so near to the water that the shipment of goods can be effected from the railway waggons direct into the ship, and *vice versa*.

To facilitate such shipment and discharge of goods, the quays are furnished with several iron cranes of various capacity. Warehouses for goods have also been erected. In front of the warehouses on the basin are placed the cranes already mentioned. In the warehouses, special care has been taken to guard against fire.

A branch railway runs from the station at Geestemunde to the docks at Bremerhafen. Ships can undergo repair in the harbour or in the dry docks, or on slips, of which there are a great number in the River Geeste.

Waterworks have been constructed at the south end of the railway station in order to supply ships with fresh water, which is conveyed by pipes to the harbour-basin, so that water-casks can be filled direct from the pipes.

The management of the harbour is vested in the Royal Harbour Board, to which a harbour-master and other subordinate officials belong.

Ships are required to pay harbour-dues in accordance with the Tariff, for the use of the lock, basin and canals, which may be seen from the accompanying Table A.

Having considered the capabilities and the conveniences of the harbours at Geestemunde, it remains to consider the amount of money which has been expended in its construction.

As far as I can make out by the inquiries, the cost of construction up to the year 1864 was about 3,100,000 thalers. There is to be added to this sum the amount expended on the construction of the railway from Geestemunde to Bremen which is about 2,700,000 thalers. The total cost up to the year 1864, therefore incurred by Hanover for the construction of the port of Geestemunde and the railway which connects it with Bremen, and thus with all railways in Germany (which is to be considered one undertaking), may be stated at least at 5,800,000 thalers. It is very likely this amount will still be increased considerably, as by the increase of commerce other warehouses, and a part for wood especially, will become necessary.

The Hanoverian Government expects that the interest on the outlay incurred for the construction of the railway will be paid by itself; but the expenses for the maintenance of the port will, it is expected, exceed the amount obtained from port dues, rent of warehouses, and other sources of income. A comparison of these charges with those of other ports will show that they are extraordinarily low, but present circumstances would not render it advisable to increase the charges, nor would such a measure be prudent, even when Geestemunde may have established a reputation as a convenient port.

With regard to annual expenses, it is further to be considered that the keeping clear the basin and the entrance to the harbour, and of the embouchure of Geestemunde, requires a large sum of money; the Weser brings down a quantity of fine earthy matter (called *schlick*), for the

clearing away of which two large steam dredging machines are continually employed.

The port has been, up to the present time, less frequented than was expected, which may be attributed to the following causes:—

1st. That the harbour has not become sufficiently known.

2nd. That commerce generally has suffered very much every where during the American war; and,

3rd. That under all circumstances, it is difficult to bring a new creation into notice, even though superior in many respects to one already well known; and,

Lastly, to the efforts made by the inhabitants of Bremen to prevent Geestemunde from injuring the interests of Bremerhafen, the commercial institutions of which are superior to its growing rival.

The Hanoverians, however, make no doubt that Geestemunde will become a very flourishing port when the advantages offered by it have become more generally known, which are especially greater depth of water and greater facility to freight and unfreight vessels, and also the excellency of the warehouses.

Geestemunde has already in a measure succeeded in transferring to itself the petroleum trade (as far as it concerns the Weser), and it is hoped that the transfer of the wood trade will also follow, as the arrangements at Bremerhafen for warehousing and stacking wood are very indifferent.

The efforts of the Government to establish a regular steam communication with England have entirely failed. The pecuniary means of the respective persons who undertook to carry the attempt into effect were insufficient to compete with the Company, Nord Deutsche Lloyd, the members of which for the most part are merchants and capitalists at Bremen. This Company has monopolized nearly all the communication on the Weser, at least as regards the regular communication with England and with America, which the Company is determined to keep to itself by every means in its power.

Nevertheless, I am given to understand that an English firm wished to establish a regular steam communication with England, but abandoned the scheme because the Hanoverian Government declined then to grant them a subsidy.

It appears the Hanoverian Government has no inten-

tion of granting any direct aid for such a purpose, being persuaded that the advantages and conveniences for vessels in the harbour of Geestemunde must eventually attract a vast number of ships, and that even the merchants of Bremen, notwithstanding their interest in Bremerhafen, will give Geestemunde the preference, where they can despatch their vessels more expeditiously and cheaper.

The warehouses and buildings at Geestemunde, I am informed, are considered extremely good, and are supplied with facilities and conveniences in every way for the purposes to which they are destined.

The accompanying Table B shows the number of vessels of all nations which have entered the harbour of Geestemunde during last year.

(Signed) WM. DORIA.

(A.)—TARIFF of Harbour Dues at Geestemunde.

There is to be paid—

Th. gr. pf.

I. For the use of the sea-harbour basin and the channels—

A. Harbour dues—

1. For each last (ton) of sea ships—

a. If they are lying up to 30 days inclusive in the harbour ..	0	2	5
b. If they are lying up to 60 days inclusive in the harbour ..	0	5	0
c. If they are lying longer, for every full or begun period of 30 days	0	0	5

2. Pilotage—

a. For piloting inward and outward, to and from the place where the ships are lying—

For ships up to 60 lasts (tons)	2	0	0
„ above 60 lasts up to 120 lasts	2	15	0
„ „ 120 „ 300 „	3	22	5
„ „ 300 „ 500 „	5	0	0
„ „ 500 lasts	5	15	0
For steamboats in transatlantic course	6	15	0

Ships which only go in and out pay half of the above.

b. For towing of ships up to 100 lasts (tonnage)	0	15	0
„ „ above 100 up to 400 lasts	1	0	0
„ „ above 400 lasts	1	15	0

II. For the use of the place which is destined for ships in the River Geeste, for each last of the sea-ships—

a. If they are lying up to 15 days inclusive there	0	1	0
b. If they are lying up to 30 days inclusive there	0	2	0
c. If they are lying longer, for every further full or begun period of 30 days	0	0	5

Wurtemberg.

2. ACCOUNT of the Remaining Description of Crops ; Extent of Land in Crop ; Total Produce ; Average Produce, 1853-62.

Description of Produce.	Average Produce per Morgen.		Years.	Morgen in Crop.	Total Produce.
	10 Years, 1853-62.	1863 and 1864.			
Cabbages	2,605	3,286 2,785	1863 1864	19,071 19,014	62,672,309 52,925,518
Rapeseed	2·40 sch.	3·10 sch. 1·7 "	1863 1864	40,424 28,355	110,673scheffel 48,463 "
Poppy-seed	2·86 "	2·10 " 2·8 "	1863 1864	8,444 10,740	24,153 " 30,305 "
Flax	93·20 lbs.	143 lbs. 128 "	1863 1864	24,196 24,923	34,734centner 31,838 "
Hemp	125·0 "	108 " 174 "	1863 1864	24,865 24,040	41,636 " 41,929 "
Hops	3·70 ctr.	4·56 ctr. 3·9 "	1863 1864	7,013 7,882	31,296 " 30,668 "
Tobacco	7·80 "	7·92 " 9·1 "	1863 1864	549 910	4,369 " 8,245 "

The cultivation of hops, notwithstanding the expense attending it owing to the high price of hop-poles, has been continually on the increase for some years.

The principal district is Rottenburg, where there are at present about 1,230 morgen under cultivation. Purchasers appear at harvest time from all parts of Germany, France, Italy, and England, the quality of Rottenburg hops being equal to the best produce of Bavaria and Bohemia.

In 1864, a Nürnberg house established a branch business, with warehouses, kilns for drying, and presses, as yet the only establishment of the kind in Wurtemberg.

The successes achieved by the Rottenburg hop growers have acted as a stimulus to hop growing throughout the country.

The prices for Rottenburg hops in 1864 varied from 60 to 100 florins.

The total produce in that year, as given above, of 30,668 centners at 70 florins, yields a value of 2,146,760 florins.

Tobacco is grown to a very limited extent in Wurtemberg, as will be perceived from the above account. The average prices in 1863 and 1864 were 9 florins 14 kreutzers, and 9 florins 15 kreutzers for the cwt. of dried leaves.

3. ACCOUNT of the Fodder Produce.

Species of Crop.	Average Produce per Morgen.		Years.	Extent in Crop.	Produce.
	10 Years, 1853-62.	In 1863 and 1864.			
	Centners.	Centners.		Morgen.	Centners.
Red clover, luzerne, and "esper"	37·15	39·04	1863	277,502	10,667,340
		30·5	1864	272,640	8,248,369
Hay and "oemd"	29·90	33·48	1863	881,607	29,472,088
		29	1864	881,607	23,364,905
Beet-root	148·3	177·8	1863	47,183	8,365,590
		136	1864	51,906	7,067,376

4. *Fruit Produce.*—The ten years' average produce of fruit from 1853 to 1862 was 4,297,925 simri seed fruit, and 771,709 simri stone fruit.

		Seed Fruit.	Stone Fruit.
		Simri.	Simri.
1863 ..		1,724,800	396,000
1864 ..		3,807,700	314,900

NOTE.—The Simri equal to $\frac{1}{3}$ English sack.

Wine.—There are 78,906 morgen of vineyard, of which the produce in the five years 1860-64 was as follows:—

Years.	Produce.	Average Prices.	Value.
	Eimers.	Fl. kr.	Florins.
1860	87,586	23 30	2,070,398
1861	69,571	60 13	4,177,923
1862	171,309	50 62	8,702,905
1863	203,560	42 54	8,736 008
1864	55,338	38 25	2,126,389

NOTE.—The Wurtemberg Eimer equal to about 160 gallons.

The vintage of the past year, 1865, has been remarkably luxuriant, owing to the long continued hot weather, not no much, however, as regards the quantity yielded as the quality of the grapes. The wine produced has been sold at unusually high prices; the actual Returns, however, are not yet published.

The exports of Würt wines to America are said to have improved, especially the red wines.

The trade with Prussia, Saxony, Hanover, &c., will, it

is hoped, be a good deal extended when the transit tax ("übergangs-steuer") in those countries is done away with.

Great improvements, however, must be made in the Wurtemberg wines, which are very inferior to those in Baden, before the demand for them in foreign countries will increase.

Corn Trade.

THE Wurtemberg corn trade has been greatly affected by the large supplies of Hungarian corn which for some time past have been pouring into the country.

During the last three years especially, this competition has been so much felt that the larger landed proprietors are already beginning to contemplate a change in their system of farming in districts where hitherto nothing but corn has been produced, and both soil and climate would permit almost everywhere a remunerative substitute in commercial plans, if either want of labourers or high wages did not stand in the way.

Smaller farmers who depend on their own labour are now abandoning more and more the growth of corn, and already realize good prices for hops, flax, hemp, and other such products.

The present state of things was clearly foreseen by many persons at a time when the extension of railways to the west had already given great expansion to the Wurtemberg corn trade, and when complaints were heard on all sides of the high price of bread.

In 1856 the Stuttgardt Chamber of Commerce observed as follows:—

"It is a fact that with the extension of railways South German corn has been gradually advancing to more and more distant markets.

"In addition to the old importers of Switzerland and the Tyrol, purchasers from the thickly populated shores of the Rhine, from continually increasing distances, and in greater numbers, appear in the South German corn markets whenever the harvests permit of supplies being drawn from thence.

"Cattle are exported in larger numbers than before. Fresh meat is sent to Paris, meat of all kinds to the Rhenish towns, even butter to England.

"It is further a fact and a consequence of the other

facilities of communication, that the large market is continually obtaining more and more the preponderance over the small market.

"International trade in corn has become almost unawares a regular and constant business in Wurtemberg.

"If bread is to become cheaper, it can only be effected by the railway system of South Germany being extended more in the direction of the agricultural states of Eastern Europe, to Galicia, and to the Austrian and Turkish Danube provinces, and in regular connexion with steam navigation on that river.

"As the railways now (1856) bring us corn purchasers from different countries, with dear bread, so will they hereafter bring corn sellers with cheap bread, and effect an adjustment of prices in the opposite direction.

"We shall be amply compensated for the 'old cheap times' by far greater advantages. We shall be secured against extreme high prices, and against the scourge of such years of want and distress as were formerly experienced."

These predictions have already begun to receive their fulfilment, and probably sooner than was expected when the above was written, although, however, the price of bread has not yet been reduced in proportion to the fall in the prices of corn.

The following is an account of the average prices of corn in the markets of Wurtemberg during the last thirty years :—

Years.	Wheat.		Rye.		Barley.		Spelt.		Oats.	
	Fl.	kr.	Fl.	kr.	Fl.	kr.	Fl.	kr.	Fl.	kr.
1833-38	10	44	7	32	7	14	4	36	4	15
1839-44	14	36	9	32	8	46	6	18	4	42
1845-50	16	1	11	15	9	30	6	33	4	56
1851-56	19	20	14	6	11	40	7	33	5	45
1857-62	18	8	11	52	10	46	6	57	6	22
1863	15	57	10	12	9	16	6	28	5	23
1864	14	51	9	35	9	7	6	12	5	41

The six years 1851 to 1856 were marked by several bad harvests.

The description of corn principally grown in Wurtemberg is spelt (dinkel). In the undermentioned eight years the prices per scheffel were as follows :—

		Fl.	kr.			Fl.	kr.
1857	..	6	58	1861	..	7	56
1858	..	5	40	1862	..	6	56
1859	..	5	22	1863	..	6	28
1860	..	6	51	1864	..	6	12

Expressed in centners (the measure according to which corn has been sold since 1862) the average prices of wheat and spelt in the year 1864 and the commencement of 1865 were respectively:—

		Fl.	kr.
In July 1864, the average price of wheat	..	6	41
In December 1864 and January 1865, ditto.	..	4	28
In July 1864, the average price of spelt	..	4	46
In December 1864 and January and February 1865, ditto	3	11	

Showing a fall respectively of 33 per cent. and 33·21 per cent.

With the period of the general expansion of trade and improvements in industry which began in 1856 and 1857, the prices rise. From the time when the Munich-Salzburg-Vienna Railway was fully opened to traffic in 1862, they begin to fall.

The wages of labour which occupiers of land have now to pay, have risen nearly 100 per cent. as compared with the past, and the rent of farms 50 per cent.

It is obvious, therefore, that if the present prices of corn continue or a still greater fall takes place, the effect must be very injurious to the agriculturists, unless some salutary measures are adopted in good time so as to render them less dependent upon the growth of corn.

That prices will continue to fall can scarcely be doubted.

Railways are being rapidly extended to the corn-growing regions of the Danube. Hungarian agriculturists will naturally avail themselves of the facilities of communication to increase their production of corn in proportion to the importing States of Southern Germany find themselves obliged to diminish their own. With the more favourable conditions of soil, climate, and wages, besides cheaper land, they will long be able to undersell the South German producer, and there does not seem to be any reason why the importation of Hungarian corn should not continue until the prices in Hungary and in Wurtemberg are reduced to the same level, with the difference only of the cost of carriage.

As long as the rate of wages and the value of land are so

much lower in Hungary than in South Germany, as to render the exports of corn profitable, it will appear in the Wurtemberg markets, and no doubt also cattle, when cattle farming is better understood in Hungary, and large numbers of fat animals can be supplied for exportation.

To maintain the balance between the cost of production, and in that way between the prices of corn in the two producing countries, wages must rise in Hungary up to those in Wurtemberg, or the rate in Wurtemberg fall to the level of that in Hungary.

In Wurtemberg the tendency is rather to a rise than to a fall, owing to the demand for labour in the manufactories, and also to emigration, which is likely to increase since the American war has been terminated ; and in Hungary, which is mainly an agricultural country, it must necessarily be an affair of some time before the rate of wages and the value of land can reach the elevation they have already attained in Southern Germany.

It seems, therefore, very probable that the farming system in Wurtemberg will undergo a gradual change, and that more attention will be directed to cattle husbandry, and the growth of commercial plants extended.

The corn business in the Wurtemberg markets in the following years was :—

			Value.	
			Centners.	Florins.
1861	2,539,154	14,381,854
1862	2,351,713	12,477,761
1863	2,382,526	11,411,804
1864	2,188,684	10,347,862

The yearly diminution in the amount of corn brought to the markets arises principally from the habit which has gained ground among producers of selling at home, thus sparing themselves the time and expense required for frequenting the market places, also to the increase of commercial mills, which make their purchases either directly from the producers in the neighbourhood, or from native or foreign corn dealers.

Heilbronn is an important staple place for corn in Wurtemberg, and considerable quantities, especially barley and oats, are exported by water to the Rhine and Holland.

The amount conveyed by water from Heilbronn in 1863 and 1864 was :—

			1863.	1864.
			Centners.	Centners.
Wheat and corn	32,058	5,075
Rye	15,832	9,816
Barley and malt	143,047	63,641
Oats and some spelt	60,441	88,224
Peas, beans, &c.	2,111	2,450
Total	253,489	169,206

The year 1864 having been in general unfavourable to trade, the demand in Holland was much less brisk, and the exports thence and also to the Palatinate and Lower Rhine less than in 1863.

The exports of the same products amounted in the undermentioned preceding years to :—

Years.	Centners.	Years.	Centners.
1856	391,042	1860	238,132
1857	277,618	1861	213,437
1858	386,171	1862	283,892
1859	244,622	1863	253,489

From 1846 to 1854, with the exception of 1848 and 1849, the imports by water exceeded the exports. Before the year 1836, the latter never exceeded 2,000 centners.

Beer.—The fall of the prices of barley from 1862 to 1863 continued in 1864, notwithstanding the luxuriant harvest of that year, so that at the close of that year they were reduced to 3 florins and 3 florins 30 kreutzers the centner.

The consequence has been that a large number of small brewers have begun to brew.

In Ulm especially the production of beer is very considerable. The amount of malt-tax paid there was 125,043 florins in 1864; from this it is calculated that 312,600 eimers of malt were brewed, which, taking into consideration the different sorts and qualities, yields a quantum of production of nearly 70,000 eimers (22,400,000 bottles), in value about 1,500,000 florins.

The brewers expect to be able to carry on a very profitable trade with France, especially to Alsace, in consequence of the reduction of the import duties by the Franco-Prussian Commercial Treaty.

Even under the former high duties on beer a not inconsiderable quantity was always sent to France.

It is also hoped that a reduction of the duty on beer in Switzerland will be one of the results of the conclusion of a Commercial Treaty by the Zollverein with that country, and that in consequence the present beer exports there will be increased.

The brewers are greatly interested in the approaching change in the excise law on spirits. As it stands at present, the employment of the brewery leavings for distilleries is rendered very difficult, almost impossible.

The produce of the excise on malt in 1863 and 1864 amounted respectively to 1,444,814 florins 36 kreutzers, and 1,553,862 florins 14 kreutzers.

The total production of malt and beer in Wurtemberg in the years 1860 to 1864 was as follows :—

Years.	Produce of Malt, calculated from an Excise of 24 kreutzers per Wurtemberg simri (equal $\frac{1}{4}$ th sack.)	Production of Beer, reckoning $4\frac{1}{2}$ simri malt to 1 Wurtember eimer (equal to 160 Imperial gallons.)
	Simri.	Eimer.
1859-60	3,072,363	682,747
1860-61	2,398,376	532,972
1861-62	3,291,491	731,442
1862-63	3,609 536	802,119
1863-64	3,884,656	863,257

Showing a gradual increase in the production of malt and beer since 1861-62, owing to the fall in the prices of barley.

A similar increase has taken place in the production of spirits during the same period :—

Years.	Produce of Excise on Brandy.	Yearly Production of Brandy, calculated from Excise of 10 fls. 40 krs. per eimer, at 50 tralles.
	Florins kr.	Eimer.
1860-61	262,593 45	24,618
1861-62	148,741 23	13,944
1862-63	184,396 40	17,287
1863-64	194,734 47	18,256

ACCOUNT of the Raw Beet-root Sugar produced, the Number of Centners of Beets consumed, and the Amount of Duty paid in the different Sugar Factories of Wurtemberg in the year 1863-64.

	Amount of Beet on which Duty was paid for manufacture of Sugar.	Duty at 26½ per centner on Fresh Beets.		Total Produce of Raw Sugar (20 centners beet-root, yield 1 centner sugar).
	Centners.	Florins	kr.	Centners.
Heilbronn factory..	360,159	159,569	30	15,008
Böblingen „ ..	143,000	62,623	46	7,150
Altshausen „ ..	278,506	119,658	49	13,675
Züttlingen „ ..	250,150	109,438	21	12,507
Stuttgardt „ ..	265,446	116,132	27	13,272
Total ..	1,292,261	567,407	54	61,612

The total value of the sugars and molasses produced at Heilbronn in the above year is calculated at from 650,000 to 700,000 florins.

The Böblingen factory will produce a great deal more than it does at present when it has the advantage or railway communication. It was originally constructed on a large scale, capable of consuming annually from 400,000 to 500,000 centners of beet-root.

In the Altshausen factory, with which two drying-houses at Ertingen and Ravensburg are connected, about 32,500 centners of various kinds of sugars were sold, 1,900 centners of molasses, 1,500 centners of bone black powder, and 3,500 centners of spirits.

The average prices of loaf sugar were 31 florins 4 kreutzers, and 29 florins 4 kreutzers in the preceding year.

The extent of land under beet-root cultivation was considerably enlarged in 1864—from 1,374 morgen in 1863 to 1,790 morgen—and the quantity produced increased by 45,000 centners.

In 1865 the number of morgen producing beet-root, connected with the factory was 2,043. The harvest was inferior, yielding only 191,285 centners of beet-root, not 100 centners to the morgen, and the prices of sugar fell.

A good deal of turf is used for fuel, but in a bad turf year, as was the case in 1864, the factory is chiefly dependent on coal. In that year the Altshausen establishment

imported 93,000 centners of coal by railway from Mannheim to Aulendorf.

The Züttlingen factory is under the same administration as that of Altshausen. The net profit of the two factories together amounted to $15\frac{1}{2}$ per cent., of which $2\frac{1}{2}$ per cent. was divided among the shareholders, and the remainder applied to covering the defect in the working capital which had been considerably reduced owing to building expenses and other causes, and which has now reached again the amount of 406,000 florins.

In 1864-65 the Züttlingen factory received for consumption 250,151 centners beet-root.

The Stuttgardt factory is the only one in private hands in Wurtemberg. In 1864-65 it consumed 192,000 centners of beet-root.

The following account shows the amount of beet-root consumed in Wurtemberg in each of the years from 1859-60 to 1864-65, the produce of raw sugar, and the duty paid:—

Years.	Total quantity of Beet-root on which duty was paid for sugar manufacture.		Total Produce of Raw Sugar.		Duty at $26\frac{1}{2}$ per centner of Fresh Beets.	
	Centners	lbs.	Centners	lbs.	Florins	kr.

Italy.

Report by Mr. Herries, Her Majesty's Secretary of Legation.

Florence, February 1866.

TABLES, which are subjoined, have been published by the Finance Department, showing approximatively the amount of each of the principal articles of trade imported into and exported from the Kingdom of Italy during the first six months of 1865 and the corresponding period of 1864, together with the amount of duty received on each article. They likewise show, in separate columns, the quantities of the goods entered at the Custom-house, and the duties paid on them under the General Tariff, and under what is termed the Conventional Tariff annexed to the Commercial Treaty of 1863 between France and Italy, and in the benefits of which Great Britain and other countries are equally entitled to participate.

The financial result of the comparison is a total increase of 2,658,219 francs in the receipts for the first half-year of 1865.

Under the head of Import Duties, the augmentation was 2,520,639 francs. Sugar alone yielded 2,654,054 francs more than in the previous half-year, the excess in the quantity imported having been 5,425,823 kilogrammes. An addition of upwards of 1,000,000 francs was obtained from a new duty of 50 centimes per hectolitre on corn and of 75 centimes per hectolitre on flour. Of the other items of increase, the most noticeable were cottons, woollens, and iron.

Wine, spirits, and coffee were the articles in the receipts from which there was the most remarkable decrease.

The greatly diminished importation of wine and brandy is ascribed to the almost entire disappearance of the grape disease in Italy, and the consequent increase of home production. On coffee, the loss to the revenue amounted to 700,000 francs, representing a falling off of more than 3,000,000 kilogrammes in the quantity imported—a result which is attributed to the accumulation of stocks towards

the close of 1864, in anticipation of the coming into operation of the additional duty then imposed.

The duties on exports gave an increase of 137,580 francs—being the difference between the excess of the receipts from oil and sulphur, and the diminution of those from all other articles liable to duty.

These Tables show an increase in the quantities imported of the following articles:—

Olive oil, sugar, chemical products, colour, cheese, leather, linen manufacturers, raw cotton, cotton manufactures, wool, woollen tissues, silk manufactures, paste, charcoal, furniture wood and furniture, paper-hangings, millinery and haberdashery, machinery, rags, iron ore, iron bars, sleepers, rails, &c.; wrought iron, copper, lead, pottery, glass.

They exhibit, on the other hand, a diminished importation of wine, brandy, various oils, cocoa, coffee, pepper, dye-stuffs, wax, soap, oil seeds, fish, animals, raw hides, hemp and flax, linen yarn, woollen yarn, raw silk, corn, flour, firewood, paper, books, hardware, pig iron, cast iron, manufactures, sulphur, coals.

Under the head of Exportation, there appears an increase in wine, olive oil, salt, oil seeds, fish, leather, cordage, cotton fabrics, silk tissues, corn, charcoal, cork, paper, iron, lead, sulphur, pottery; and a decrease in volatile oils, confectionery, manna, liquorice, lemon and orange peel, &c.; chemical products, dye-stuffs, soap, soda, fruit, almonds, cheese, animals, hempen fabrics, cotton yarns, silk, rice, paste, fire-wood, books, rags, bones.

I have endeavoured, by comparing the Returns for 1865 with those for the corresponding period of 1863, to ascertain how far the revenue was affected by the several reductions of duty contained in the Conventional Tariff, which came into operation in 1864; but after a careful examination of each item I have found it impossible, without more detailed statements, to arrive at any accurate conclusion.

The difference between the Customs receipts for the first half-year of 1863 and those for the first half-year of 1865 appears from the following figures:—

IMPORT DUTIES.

				Francs.
1863	21,567,539
1865	23,256,485
Increase in 1865				1,688,946

EXPORT DUTIES.

				Francs.
1863	2,336,789
1865	1,740,437
Decrease in 1865				596,352

TOTAL RECEIPTS.

				Francs.
1863	23,904,328
1865	24,996,922
Increase in 1865				1,092,594

In looking at the increase of the receipts from duties on imports, it must be borne in mind that nearly two-thirds of the amount was derived from the new duties on corn and flour, which produced 1,029,740 francs in the first six months of 1865.

The decrease under the head of Exports is almost entirely accounted for by the reduction of the duties on oil and sulphur, and a diminished exportation of the latter article.

Some progress has been made in commercial statistics. Those for the year 1862 showed in detail for the first time the commercial movement of the whole Kingdom of Italy, and a comparison of one year with another has now been rendered possible by a recent compilation of Tables of a similar nature for 1863.

This work contains twenty tabular statements.

The three first comprise the importation, exportation, and transit of the several articles specified in the Tariff, showing in separate columns their quantities and value, both official and commercial; their origin and destination; the mode of transport, whether by land or by sea; and under foreign or national flag.

Tables 4, 5, and 6 give, in a more condensed form, recapitulations of the preceding statements of imports and exports.

Under No. 7 there is a series of tables exhibiting in detail the trade of Italy with foreign countries separately, in the order of their importance of their commercial transactions during the years 1861, 1862, and 1863. The figures for 1861, however, are of little use for the purpose of comparison, as they are quite imperfect, the Returns from Sicily being wanting. The general results are recapitulated in Tables 8, 9, 10, and 11.

No. 12 gives the value of goods sent in transit through Italy. No. 13 the receipts of the Custom-house for 1862-63, and No. 14 the official value of imports and exports in 1861 (without Sicily), 1862, and 1863. Nos. 15, 16, and 17 are devoted to the mode of transport of imports and exports.

Tables 18, 19, and 20 are confined to the statistics of movement of the free port of Genoa.

The several articles specified in all these tables are not enumerated in alphabetical order, but are arranged according to their classification in the Tariff in twenty categories, viz. :—

- | | |
|--|-------------------------------------|
| 1. Waters, beverages, and oils. | 9. Cottons. |
| 2. Colonial produce, vegetable juices, drugs, chemical products, colours, dye stuffs, perfumery, &c. | 10. Woollens. |
| 3. Fruit, seeds, vegetables, plants, &c. | 11. Silks. |
| 4. Fatty substances, provisions, &c. | 12. Grain, pulse, and paste. |
| 5. Fish. | 13. Wood. |
| 6. Cattle. | 14. Paper and books. |
| 7. Hides, leather, &c. | 15. Mercery, hardware, &c. |
| 8. Hemp, flax, and article manufactured therefrom. | 16. Common metals. |
| | 17. Gold and silver, jewellery, &c. |
| | 18. Stones, earthen, minerals, &c. |
| | 19. Pottery and glass. |
| | 20. Tobacco. |

The amount of each article imported or exported is stated in parallel columns headed General Commerce, and Special Commerce. The former designation includes all articles which enter the kingdom whatever may be their ultimate destination, and all articles which are sent abroad whatever may be their origin. The latter applies, with regard to imports, to all goods taken for home consumption, or to such as previous to re-exportation may have given rise to commercial transactions, and for exports to national produce, or to articles deemed to be assimilated thereto, by reason of the payment of duties on their importation, or in consequence of commercial transactions.

The valuation of each article is twofold—official and commercial. The former is permanent, and the latter is determined by taking the mean of the prices fixed by the Chamber of Commerce.

An analysis of the several statements to which I have referred, gives the following general results :—

The commercial or computed real value of the whole of the imports and exports together (general commerce) amounted in 1863 to 1,682,559,288 francs, against 1,568,633,994 francs in 1862, being an increase of $7\frac{1}{3}$ per cent.

In special commerce it was 10 per cent., the total commercial value of the united imports and exports being 1,536,044,118 francs in 1863, and 1,407,497,704 francs in 1862.

An increase of 8 per cent. is apparent in the general commerce of importation, which amounted in 1863 to 982,293,652 francs, and in 1862 to 911,145,161 francs.

In the general commerce of exportation amounting to 700,265,636 francs in 1863, and to 657,488,833 francs in 1862; the augmentation was 9 per cent.

A comparison of the special commerce of 1863 with that of 1862 shows an increase of 9 per cent. in imports, and 10 per cent. in exports. The total commercial value of the former was, in 1863, 902,185,066 francs, and in 1862, 830,029,347 francs. The value of the latter was, in 1863, 633,859,052 francs, and in 1862, 577,468,357 francs.

Of the imports 72 per cent. belonged to six classes of articles :—

				France.
Silks, &c.	175,445,615
Colonial produce, &c.	128,104,338
Cereals	121,352,320
Cottons, &c.	88,669,967
Woollens, &c.	73,089,708
Common metals	69,516,179
				650,178,127
All other classes	252,006,939
Total				902,185,066

Six principal classes comprised 84½ per cent. of the exports, thus—

				Francs.
Silks, &c.	246,757,462
Waters, beverages, and oils..	13,224,761
Fruit, &c.	66,182,784
Cereals	57,160,208
Colonial produce	41,578,970
Stones, earths, &c.	41,407,843
				536,312,028
All other classes	97,547,024
Total..				633,859,052

The increase or decrease of the special commerce of 1863, as compared with that of 1862, in each of the categories into which it is divided will appear from the following summary:—

	Imports.				Exports.			
	Commercial Value.		Increase.	Decrease.	Commercial Value.		Increase.	Decrease.

The total value of the special commerce of Italy (imports and exports together) was 1,536,044,118 francs, of which amount more than three-fourths represented the dealings with four countries—France, Great Britain, Austria, and Switzerland.

The value of the importations from France was 266,894,487 francs; exceeding that of the previous year by 14 per cent.

The exports to France show an increase of $24\frac{1}{2}$ per cent., their value being 237,464,819 francs.

The principal articles imported and exported were as follows:—

IMPORTS.

	Francs.		Francs.
Silk, raw and thrown ..	45,074,926	Glass, plate and cut ..	4,225,212
Silk tissues ..	21,065,656	Coffee ..	4,002,889
Woollen tissues ..	24,399,034	Paper and books ..	3,671,141
Sugar ..	26,240,344	Leather ..	3,333,678
Cotton tissues ..	19,454,868	Copper and brass ..	2,857,745
Guns ..	8,901,902	Fish ..	2,437,887
Hardware and mercery	8,345,124	Clocks and watches ..	2,440,401
Iron ..	6,725,126	Linen manufactures ..	2,319,677
Fermented liquors ..	6,512,663	Silk cocoons ..	2,154,568
Chemical products ..	4,907,316	Horses and mules ..	2,399,240
Gold and silver ..	4,751,993	Oils of all kinds ..	2,368,068
Silkworms' eggs ..	4,460,850	Spirits ..	2,320,192
Raw wool ..	4,462,003	Coals ..	2,383,650
Raw hides ..	4,397,166		

EXPORTS.

	Francs.		Francs.
Silk, raw and thrown	121,266,758	Hides ..	2,157,329
Oils of all kinds ..	18,406,371	Iron ore ..	2,524,383
Wheat ..	16,447,415	Cotton ..	2,049,387
Sulphur ..	11,061,393	Chemical products ..	1,691,014
Waste silk ..	6,971,733	Marble and alabaster ..	1,894,444
Cattle ..	6,111,020	Wool (raw), hair, &c..	1,905,188
Rice ..	4,966,370	Calves, goats, &c. ..	1,616,254
Fruit ..	3,916,555	Charcoal ..	1,400,620
Dye stuffs ..	3,555,812	Silk cocoons ..	1,430,858
Fatty substances, &c..	3,354,937	Cereals ..	1,318,408
Hemp and flax ..	2,236,778	Seeds ..	1,165,532

It must be borne in mind that many of the articles which appear in the statement of the trade with France in reality only passed through that country from and to other countries—England in particular.

The imports from Great Britain in 1863 are valued at 203,006,046 francs, an amount exceeding by $5\frac{1}{2}$ per cent. that of the imports of the previous year. The principal articles were,—

	Francs.		Francs.
Iron of the first fabrication ..	31,674,890	Spirits ..	3,620,703
Cotton tissues ..	27,321,423	Copper and brass ..	3,734,798
Woollen tissues ..	16,216,581	Dye stuffs ..	3,591,334
Cotton yarn ..	15,696,758	Wheat ..	3,181,477
Coals ..	11,813,733	Silk tissues ..	3,043,965
Fish ..	10,716,630	Fatty substances, &c. ..	3,135,194
Sugar ..	8,425,330	Oils of all kinds ..	2,676,777
Hides ..	7,807,746	Silkworms' eggs ..	2,665,350
Coffee ..	6,190,062	Machinery ..	2,084,222
Linen yarn ..	4,884,457	Silk, raw and thrown ..	1,937,220
Raw cotton ..	4,979,562	Sulphur ..	1,608,726
Chemical products ..	3,662,345	Hardware and Mercery ..	1,400,809

In exports to Great Britain there was a decrease of 8 per cent., there being 87,516,225 francs in 1863 against 94,827,970 francs in 1862.

The principal articles were,—

	Francs.		Francs.
Oils of all kinds ..	17,232,083	Seeds ..	1,947,914
Fermented liquors ..	11,495,308	Wheat ..	1,305,072
Fruit ..	12,447,817	Vegetable juices ..	952,616
Dye stuffs ..	8,489,950	Silk tissues ..	870,886
Sulphur ..	9,066,125	Paper and books ..	647,067
Chemical products ..	6,926,543	Drugs ..	599,092
Silk, raw and thrown ..	2,950,918	Timber ..	582,841
Furniture wood ..	1,691,548	Raw hides ..	527,382
Sundry articles of hardware and mercery ..	1,441,644		

The country which stands next on the list is Austria. It sent to Italy in 1863 goods to the value of 146,531,729 francs against 138,570,068 francs in 1862. In export from Italy to Austria there was an increase of 24 per cent., from 56,426,827 francs in 1862, to 69,847,033 francs in 1863.

The imports consisted principally of the following articles:—

	Francs.		Francs.
Silk ..	38,177,290	Cereals ..	2,323,571
Corn ..	10,506,662	Coffee ..	1,813,833
Silkworms' eggs ..	8,869,950	Fatty substances, &c. ..	1,736,991
Timber ..	8,624,364	Raw hides ..	1,784,238
Cocoons ..	6,354,930	Calves, goats, &c. ..	1,541,123
Woollen tissues ..	6,016,339	Plate and cut glass ..	1,752,473
Sugar ..	5,012,468	Mercery and hardware ..	1,309,529
Iron, cast and wrought ..	5,602,751	Manufactures of hemp and flax ..	1,348,999
Cattle ..	4,863,657	Horses, mules, &c. ..	1,220,000
Waste silk ..	3,978,495	Dye stuffs ..	1,171,726
Wool ..	3,018,178	Copper and brass ..	1,101,703
Cotton tissues ..	2,969,778	Glass ..	1,116,672
Spirits ..	2,917,987		

The principal articles of export to Austria were,—

	Francia.		Francia.
Fruit	17,067,448	Sundry articles of mer-	
Oils	9,565,412	cery and hardware..	1,026,371
Hemp and flax ..	7,557,640	Vegetable juices ..	667,758
Fermented liquors ..	5,645,661	Wheat	828,892
Grain, &c. ..	4,185,536	Waste silk	706,617
Raw and thrown silk .	3,467,326	Cordage	651,094
Rice	2,133,432	Paper and books ..	625,019
Sulphur	1,699,283	Drugs	472,849
Cheese	1,457,848	Cattle	437,535
Seeds	1,276,180	Leather	409,654
Linen tissues, &c. ..	1,561,297	Linen yarn.. ..	413,774
Silk tissues.. ..	1,508,260	Iron	350,609

The value of the imports from Switzerland in 1863 is estimated at 73,617,428 francs, being a decrease of 10 per cent. as compared with the imports of the previous year. In the exportation of Italian produce to Switzerland there was a falling off of 18 per cent., its value being 114,977,282 francs in 1863 against 136,031,153 francs in 1862.

The principal imports were,—

	Francia.		Francia.
Silk	22,870,240	Leather	1,025,465
Cotton tissues ..	9,801,743	Dye stuffs	795,408
Woollen tissues ..	9,731,512	Linen tissues ..	952,197
Cheese	5,568,597	Paper and books ..	632,339
Timber	3,151,754	Horses and mules, &c.	596,465
Silk tissues.. ..	2,926,635	Gold and silver ..	552,767
Cattle	1,682,129	Firewood	519,162
Hardware and mercery	1,555,541	Linen yarn	499,253
Clocks and watches ..	1,401,808	Raw wool	494,819
Cotton yarn	1,497,513	Waste silk	469,656

The exports to Switzerland consisted chiefly of—

	Francia.		Francia.
Raw silk	93,391,931	Hats	690,584
Waste silk	5,571,306	Hides	543,079
Fermented liquors ..	2,077,479	Cocoons	588,042
Mercery, &c. ..	1,845,086	Silk tissues.. ..	344,690
Cereals	1,362,467	Calves, goats, &c. ..	246,373
Rice	1,006,251	Raw cotton	200,872
Hemp and flax	769,203	Leather	193,547
Wheat	918,891		

The same observation will apply to the trade with Switzerland as to that with France, namely, that it is made to appear much larger than it was in reality by including many articles belonging to the commerce of other countries with Italy.

The transit of goods through Italy in 1863 was considerably less than in 1862, their value having fallen from

80,020,476 francs to 66,406,586 francs. The countries from which they arrived were principally Switzerland, France, England, Austria, Tunis, and Tripoli, and the South American Republics. They were destined chiefly for Austria, Switzerland, the Roman States, France, North America, and Turkey.

The principal articles of transit were those included in the classes of wool, cotton, colonial produce, chemicals, &c., silk, beverages, and mercery and hardware.

With regard to means of transport, it appears that $35\frac{1}{2}$ per cent. of the whole of the imports and exports in 1863 were conveyed by land and $64\frac{1}{2}$ per cent. by sea; 26 per cent. under Italian and $38\frac{1}{2}$ per cent. under foreign flags. As compared with 1862, there was a diminution of $1\frac{1}{2}$ per cent. in land traffic and an equivalent augmentation of sea carriage under foreign flags, the proportion of transport under the national flag remaining the same.

The goods introduced into the free Port of Genoa in 1863 were to the value of 93,791,025 francs against 127,008,108 francs in 1862, and 103,201,729 francs the average of the five years 1858-62.

A series of Tables will be found annexed, showing in a summary form for 1863 the amount of imports and exports in each class of the Tariff, the amount of the imports from and exports to each of the foreign countries trading with Italy, the amount of the transit trade, and the receipts from Customs duties in each of the years 1862 and 1863.

(Signed) EDWARD HERRIES.

Denmark.

Report by Mr. Petre, Her Majesty's Secretary of Legation.

Danish Exports to Great Britain in 1865.

Copenhagen, February 20, 1866.

UNTIL the official Returns are published by the Danish Government (and they are usually twelve months in arrear), I have no statistical data for a complete and comprehensive review of the foreign trade of Denmark during the past year. But as regards the export trade to Great Britain, which constitutes by far the most important element of the commercial prosperity of Denmark, I am able to give an approximate analysis of it for the past year by collating the Returns which have been lately published by the two or three great exporting agents through whose hands pass the whole, or nearly the whole, of the exports to Great Britain from Copenhagen and the ports of Jutland. These Returns deal only with exports.

One of the natural consequences of the separation of the Duchies from Denmark has been to divert the export trade in cattle and agricultural produce from its ancient channels, and to create an active direct export trade from the Jutland ports, Aarhus and Aalborg, and at the same time to increase that branch of trade from Copenhagen, to Leith, Newcastle, Hull, and London. For the first time direct and regular steam communication has been established between the ports of Jutland and Great Britain.

Owing to the prolonged severity of the winter of 1864-65, the summer had set in before the steamers employed in this trade began to ply, but even this short experience augurs well for the future importance of this natural outlet for the rich agricultural and animal produce of Jutland and Fünen. Previous to the late war it was a common practice of the Jutland farmers to send their cattle destined for exportation to fatten in the Duchies, and nearly the whole of the cattle exported to Great Britain were shipped at Tönning or at Hamburg.

The Danish Government learnt with some surprise and considerable satisfaction from the British Returns of imports and exports during the first three quarters of 1865, published by the Board of Trade, that the value of Danish exports to Great Britain during the nine months in question not only exceeded the value of those exports for the corresponding period of 1864 by 382,846*l.* sterling (an increase which the war might reasonably account for), but even exceeded by some few thousand pounds the united value of the exports from the Kingdom and the Duchies together in 1863. These figures show conclusively, at all events as far as Great Britain is concerned, that Denmark has not suffered in the value of her export trade by the loss of the Duchies. The ravages of the cattle plague in England and Scotland, from which Denmark has hitherto been spared, have doubtless given an exceptional impetus and value to her cattle trade.

From a compilation and comparison of the Returns before alluded to, I have framed the subjoined approximate statement of the quantities of the principal articles exported to Great Britain in 1865, showing, at the same time, what proportion of those exports went to Scotland as compared with England, and how they were divided between Copenhagen and the ports of Jutland.

EXPORTS to Great Britain in 1865.

Corn	5,638 tönnes	11,371 tönnes

Scotland, as will be seen from the first of the foregoing Tables, absorbs the greater part of the Danish exports to Great Britain. Taking the most important items, such as butter, bacon, flour, dried fish, and oil-cake, the exports to Leith were in the aggregate three times greater than the whole of the exports to the three English ports above-named. Of the 39,617 head of cattle, including sheep and pigs, exported, 26,754 went to Leith. With the exception of bran, wool, and alum, the Returns show a considerable increase in all the exports as compared with the previous year, but the most notable increase was in the exports of butter and bacon; nearly 6,000,000 lbs. of the former, valued at 330,000*l.* sterling, were sent to Great Britain in 1865, as against 4,000,000 lbs. in 1863, and of bacon and hams 3,500,000 lbs. as against 1,500,000 lbs. There was an increase, too, of 500,000 lbs. of oil-cake over 1864, which is a considerable article of exportation and goes chiefly to Leith; this increase is somewhat remarkable in a year when fodder was so scarce as it was in Denmark in 1865. The economical wisdom of exporting such a large quantity of oilcake instead of fattening cattle with it at home has been called in question, particularly as Danish farmers naturally look to the requirements of the English market,

where fat cattle command a higher price in proportion than half-fattened beasts. The number of cattle, sheep and pigs, exported from Denmark to England and Scotland in 1864 was only 206; in 1865, as already stated, 39,617 were exported. The almost total cessation of the exportation of cattle in 1864 is assignable, of course, to the war.

The development and future success of this newly established branch of direct export trade to Great Britain is a matter of much interest and importance to Danish agriculture, and the efforts of the Royal Agricultural Society of this kingdom have already been directed towards those ends by recommending that only first-class steamers should be fitted up for the transport of cattle, by appointing agents to superintend their shipping and to see that proper care is taken of the cattle on their voyage. It appears from a statement of one of these supercargoes that the average losses in the voyage during the past year were as follows:—of horned cattle 1 in 500; of sheep 3 in 500; of pigs 16 in 500.

Considering that the journey across the North Sea occupies generally four days, and often more, the per-centage of loss is trifling enough, and indicates careful management. Freights were moderate in the summer, but increased in the autumn of the year. The prices were as follows:—cattle 1*l.*, and later 1*l.* 5*s.* per head; sheep 2*s.* 6*d.*, and later 3*s.* Three-fourths of the cattle exported to Great Britain went, as will be seen above, from Jutland, the great cattle-breeding province of the Kingdom; whereas nearly two-thirds of the sheep and pigs were exported from Copenhagen. The exports of corn by steamer, which alone figure in the returns which I have analysed, constitute presumably but a small proportion of the total exports of that article in the year. These can only be ascertained with precision, at least from Danish sources, when the official returns for 1865 are published.

In conclusion, it may fairly be said that a country of the now narrowed dimensions and reduced population of Denmark which can send in one year to the British markets alone about 6,000,000 lbs. of butter, 6,000,000 lbs. of bacon, 3,000,000 lbs. of flour, in addition to nearly 40,000 head of cattle and sheep, although it has suffered cruelly in many respects by the late war, is a country which still possesses the essential elements of vitality and of future material prosperity.

(Signed)

GEORGE PETRE.

P.S.—The official tables showing the Danish exports and imports for the year 1864 have recently been published by the Statistical Department, and, as soon as I have had time to analyse them, will form the subject matter of a supplementary Report.

G. P.

Spain.

Report by Mr. West, Her Majesty's Secretary of Legation.

Madrid, January 1, 1866.

I HAVE already had occasion to allude to the state of the Spanish population. It is, perhaps, one of the most unfortunate results of the system of government adopted in former times, and the most serious impediment to future political, social, and commercial progress. The division of the adult male population and the numbers of each class is a remarkable confirmation of this. I find, according to statistical information recently published, the following distribution in the year 1860:—42,765 clergy, 11,166 sacristans, 1,335 bellringers, 4,233 choristers and acolytes, 1,350 singers, 906 organists, 322 porters and beadles, and 1,683 religious establishments composed on the low average of 50 monks each; the whole ecclesiastical class, therefore, numbered 146,227. The Government employés in active service numbered 65,879, and 7,215 received pensions. There were only 5,009 merchant captains, and the mercantile marine consisted of only 39,437 seamen. 19,528 professors, teachers, and schoolmasters, 36,140 students of the second class, 11,375 of the first class, and 7,029 destined for special professions. 11,991 avocats, 5,061 notaries, and 2,549 procureurs; 13,994 doctors, and 8,152 veterinaries; 1,884 architects, 2,329 land surveyors, 1,466,061 proprietors, 510,527 tenant farmers, 71,556 merchants, 13,457 manufacturers, 278,829 persons engaged in industrial pursuits, 551,002 artisans, 23,358 miners, 99,728 manufacturing workmen, 2,854,110 common labourers, 401,833 servants, 88,957 poor, 6,346 deaf and dumb, 39,020 blind and infirm, and 3,989 chemists and druggists. According to the source from which I have drawn these figures, the military force in 1860 was stated to be composed of 147,145 regular troops, 11,192 veterans, and 10,280 marines, making a total of 168,617. I will not, however, vouch for the accuracy of this last state-

ment at the present moment, as it is a matter of extreme difficulty to ascertain the correct numbers of the effective forces employed.

Taking these figures, which are probably under the mark, it will appear that over 6 per cent. of the adult population of 6,461,153 is lost to the agricultural and commercial interests of the country, without taking into account the lawyers and professors.

It is when some signs appear of increasing prosperity, some indications of future amelioration, that such facts unfortunately present themselves, and seem at once to destroy all hope. We look in vain for the material. Railroads have been made and are making, but this very paucity of population and consequent want of traffic, combined with the difficulties of access, have rendered them, hitherto at least, complete failures in a financial point of view. The following quotation of the shares in 1860 and 1865 is a sufficient proof:—

	1860.		1865.	
	Fr.	c.	Fr.	c.
Madrid- aragossa	560	0	232	0
Seville-Xeres	521	75	45	0
Cordova	480	0	160	0
North Line	485	0	182	50
Pampluna	482	50	115	0
Barcelona-Saragossa	472	50	105	0

This is not an encouraging state of affairs. It rests, however, with the Government to find some means of saving these lines from complete bankruptcy. There can be no doubt as to the ultimate advantage of their construction, but it is a question of time. There are a great many proposed lines which, if ever completed, would form a tolerably perfect net-work. The line along the Portuguese frontier would entirely deprive that country of the carrying trade of the interior of Spain, which would find issue to the north at Santander, and to the south at Huelva and Cadiz. It is almost impossible that with a population under 16,000,000, in a country nearly as large as France, there should be any considerable traffic, more especially as the trunk lines traverse those portions of the country in which there are no roads; but the mere construction of them is an immense gain. If this railway system were honestly and fairly worked out by the Govern-

ment, and the investment of foreign capital properly protected as well as encouraged, it would become the means of regenerating the country, and do more than anything else towards civilising the people and uprooting their inveterate prejudices. A striking example of injury to the national interests is to be found in the maintenance of the differential duties on merchandise imported in foreign ships.

The number of Spanish ships which entered Spanish ports between the years 1850 and 1862 was 4,216; the quantity of merchandise, 226,224 tons; and the number of seamen employed, 59,969.

The number of foreign ships during the same period was 4,199, with cargoes to the amount of 943,873, and employing 40,961 seamen.

The number of Spanish ships which cleared was 3,466, cargoes 209,915, seamen 45,012, and the number of foreign ships, 3,216; cargoes, 529,014; seamen, 34,697. It results, therefore, that although there were 267 more Spanish than foreign ships, they carried 1,036,748 tons of merchandize less, and required 29,053 seamen more. The Spanish ships measured 934,724 tons, and carried only 436,139 tons of cargo; thus showing a loss of space of 53·34 per cent., while this loss in the foreign ships was 0·46 per cent. The average amount of cargo carried by each Spanish ship was 56·92 tons, while the foreign ships averaged 196·64 tons.

Each Spanish ship employed one man for every 4 tons. Each foreign ship one man for every 17 tons.

Unless there is a change in the system, it is clear that ere long the Spanish mercantile marine will be forced to content itself with the coasting trade. In almost every other country the greatest pains are taken to build as cheaply, and at the same time as commodiously, as possible. But in Spain it is otherwise. Means are adopted to enhance the cost of ship-building, and maritime regulations increase the cost of navigation. To counterbalance this, then, the Government have adopted the differential duty, and such appears to be the attachment for this species of protection, that although the produce of the northern provinces is oftentimes sent to Bordeaux for shipment in French bottoms on account of the high rate of Spanish freights, still the fact that the national shipping is only bolstered up in this manner in order to enable it just to

hold its own against the foreign, seems not to be recognized. The very idea of the abolition of this duty is alarming to the shipping interest; for relying on its privileges to maintain its superiority, it has made no exertion to improve its material, and foresees with dread, if they should be withdrawn, the successful competition of the foreigner. The same system which in former times ruined the internal commerce of the country, is still at work to ruin its external commerce.

The following is a return of the Spanish and foreign shipping, exclusive of British, for the district of Barcelona, from 1861 to 1865 :—

Years.	Entered.			Cleared.		
	Vessels.	Tons.	Value of Cargo.	Vessels.	Tons.	Value of Cargo.
			£			£
1861	5,475	586,285	7,494,496	5,405	514,200	2,417,975
1862	5,333	564,939	6,815,000	5,156	499,963	2,055,120
1863	5,540	554,271	6,434,625	5,377	504,070	2,863,000
1864	3,469	526,762	5,824,040	3,390	508,218	3,112,120
1865	2,955	418,824	5,374,580	2,870	404,815	2,488,110

The British shipping during the same period fell from 133 vessels to 91, and the value of the cargoes from 308,605*l.* to 101,850*l.* Mr. Consul Barrie reports from Alicante that “the trade of this port has diminished considerably.” He gives a return of 163 British ships in 1864, and 107 in 1865; Spanish ships, 558 in 1864, and 464 in 1865. At Valencia he reports a like diminution. I now turn to the Government Returns for 1861, which uniformly show an increase over the previous year 1860, but which are unable to conceal the decrease over five years. The following is the official Table :—

Ships entered and cleared under national and foreign flag	..	21,882
Diminution over 5 previous years	..	2,188
Under national flag	..	10,755
Diminution over 5 previous years	..	1,558
Under foreign flag	..	11,127
Diminution over 5 previous years	..	1,100

The number of Spanish ships which entered Spanish ports during the same year was only 3,221, measuring 273,638 tons, against 4,093 foreign ships, measuring 745,228 tons.

The number of ships under national flag which entered the ports of the Balearic Islands was 7,289, and the number of those which cleared 5,645. The number under foreign flag was 7,135 entered, and 5,701 cleared.

In the Canary Islands the Returns were :—

Entered under national flag	205
Cleared, ditto	94
Entered under foreign flag..	167
Cleared, ditto	115

Such, then, is the state of the Spanish mercantile marine under a system of differential duties, and it is another proof that the spirit of former legislation is still alive; for, notwithstanding facts which are patent to all, the Government still continue to maintain them. Señor Pastor, in a speech during the last session of the Spanish Cortes, proved most conclusively the inutility of them to protect the shipping interest. He took the amount of imports and exports in 1850 as compared with 1862, and showed that the quantity of goods imported and exported in Spanish bottoms decreased from 303,000 to 202,000 tons, while the quantity imported and exported in foreign bottoms increased from 269,000 to 818,000 tons.

The cost of ship-building in Spain is considerably greater than in other countries, and is always brought forward as an argument in favour of its protection against competition; but the fact that it is so solely because of the enormous duties levied on all materials necessary for the construction of ships seems hitherto to have been ignored. The attention of the Government has, however, of late been turned to this subject, and it is to be hoped that some modification of the existing rates of duty on these articles may be made. Such a measure would likewise greatly benefit the coasting trade, which is already considerable.

The following is a Return showing the value of the merchandise circulated by the coasting trade during the year 1863 in each of the maritime provinces :—

Provinces.	Entered.	Cleared.	Total Entered and Cleared.
	Reals vellon.	Reals vellon.	Reals vellon.
Alicante.. ..	213,248,475	151,677,333	364,925,808
Almeria.. ..	50,637,725	40,993,511	91,631,236
Barcelona.. ..	361,056,533	558,375,269	949,431,802
Cadiz	298,737,948	183,752,667	482,490,615
Castellon	18,457,219	17,950,297	36,407,516
Corunna.. ..	108,868,321	68,517,766	177,386,087
Gerona	25,563,311	9,701,876	35,265,187
Granada.. ..	13,939,212	21,449,572	35,388,784
Guipuzcoa	20,275,140	14,721,446	34,996 586
Huelva	37,685,793	40,544,920	78,230,713
Lugo	16,512,411	8,855,883	25,368,294
Malaga	161,548,734	108,855,800	270,404,534
Murcia	116,017,392	42,698,520	158,715,912
Oviedo	101,275,847	32,066,306	133,342,153
Pontevedra	58,648,470	52,748,629	111,397,099
Santander	53,481,767	110,007,432	163,489,199
Seville	164,012,110	82,490,560	246,502,670
Tarragona	116,164,862	110,845,718	227,010,580
Valencia.. ..	90,368,625	173,346,445	263,715,070
Vizcaya	39,050,762	44,668,803	83,719,565
Balearic Islands	115,185,940	80,772,349	195,958,289
Canaries.. ..	19,704,133	18,952,250	38,656,383

Total value of merchandise entered	Reals vellon.
Total value of merchandise exported	2,200,440,730
	2,003,993,352
Difference	196,447,378

If these figures can be relied upon, it would seem that the value of the merchandize transported by the coasting trade exceeds that of the whole foreign commerce of the country.

Thus—

Value of coasting trade, 1863	Reals vellon.
Value of foreign commerce, 1861	4,204,434,082
	3,300,094,274
Difference	904,339,808

an excess of over 9,000,000*l.* sterling in favour of the value of the coasting trade. It has increased likewise during the last five years in value 545,209,906 reals vellon, and over the previous year 72,795,891 reals vellon.

The principal articles of national produce transported are—oils, olives, starch, brandy (*aguardiente*), cotton twists, different kinds of almonds, sugars, prepared clays and earths, wax candles, boots and shoes, raw hemp and flax, coal, wax, copper of different sorts, nutritious pre-

serves, coral in its natural state, cork in all states, barks, tanned leathers, drugs and medicinal articles, esparto, powder, salt, tobacco, matches, dried fruits, green fruits, pigs, sheep and all kinds of live stock, grain of all kinds, and fish, flour, iron in bars, mineral products, tin, lead, paper, wool and woollen goods, silk and silken goods.

The number of ships engaged in this trade was, in 1863, 58,670, measuring 2,900,259 tons, and carrying 430,411 seamen.

The following Table shows the number which entered and cleared for each of the maritime Provinces :—

Provinces.			Ships Entered.	Ships Cleared.
Alicante	4,024	4,141
Almeria	1,677	1,663
Barcelona	6,645	6,741
Cadiz	5,440	5,428
Castellon	1,833	1,659
Corunna	2,760	2,877
Gerona	1,542	1,530
Granada	504	868
Guipúzcoa	1,238	1,260
Huelva	2,774	2,929
Lugo	606	627
Malaga	4,087	4,069
Murcia	3,070	3,128
Oviedo	2,315	2,392
Pontevedra	1,556	1,774
Santander	1,526	1,351
Seville	1,641	1,631
Tarragona	4,337	4,475
Valencia	4,158	4,138
Vizcaya	1,642	1,614
Balearic Islands..	2,902	2,802
Canaries	1,993	1,974

As compared with the previous year there is an increase of 1,843 ships, measuring 259,487 tons. Thus, notwithstanding the impediments thrown in its way, this trade maintains itself and prospers to a certain extent. These impediments are, however, unfortunately not looked upon as such, but on the contrary seem to be considered in the light of measures necessary for its protection. The idea even of opening the coasting trade would, I should suppose, produce a state of things similar to what would occur in Catalonia if any injury should be done to the contraband trade in those Provinces by the reduction of the Custom duties, or other measures which in other countries are now

generally considered to be conducive to commercial progress, but which in Spain would be considered as tantamount to selling Spanish interests to the foreigner.

By fortuitous events this country was once raised to the highest pitch of national prosperity, and her rulers and statesmen fondly imagined that no competitors could arise to dispute her ascendancy ; but events have proved how illusory such ideas were, and the force of circumstances is at length effecting, it may be hoped, what legislation has not only never attempted, but ever impeded, namely, the development of the internal resources of the country.

(Signed)

L. S. SACKVILLE WEST.

United States.

Report by Mr. Burnley on the Iron and Steel Trade in the United States.

Sir F. Bruce to the Earl of Clarendon.

My Lord,

Washington, March 6, 1866.

I INCLOSE a very valuable Report prepared by Mr. Burnley, on the iron and steel trade in the United States.

The heavy existing duties appear insufficient to check foreign competition, and a higher tariff is recommended.

In the meantime strikes for higher wages prevail among the workmen, and the eight hours movement is spreading, the men arguing that as the masters are protected against the foreigner by legislation, they are entitled to be secured by legislation in an increased share of the profits.

I have, &c.

(Signed) **FREDERICK W. A. BRUCE.**

Inclosure 1.

Mr. Burnley to Sir F. Bruce.

Sir,

Washington, March 5, 1866.

A MEETING took place recently in this city of the American Iron and Steel Association, a full account of which is herewith inclosed, at which some statistics of a valuable nature were presented, bearing upon the present state of the trade and its probable future.

The meeting was attended by delegates from Pennsylvania, New York, Ohio, Michigan, Indiana, Illinois, and Massachusetts; the object of the meeting being the development of the industrial sources of the country, and the protection of American industry.

The main question was "whether manufactured iron can be produced at lower than the present ruling rates; if not, then the American mills must either cease work or lower the wages of their workmen;" that wages must be

reduced "below the living rate of sustaining a good class of workmen, or the business of supplying the American market with rails and bar iron must be yielded to foreigners," and the only way in which such a disastrous result could be avoided, was by increasing the duty on imported iron by Act of Congress.

"Our only security," says the Secretary, "under high taxation and high cost of living lies therefore in the expectation of procuring an alteration of the tariff laws, and perhaps some abatement of the internal revenue tax upon iron."*

A statistical comparison of the past two years shows that the total production of anthracite iron in the United States was, for 1864, 684,018 tons; for 1865, 479,558 tons; or a decrease for the latter year of 204,460 tons, something like 30 per cent. less than was made in 1864.

Of raw coal and coke iron, manufactured principally in Pennsylvania, Ohio, West Virginia, and Maryland, the total for 1864 was 202,171 tons; for 1865, 179,007 tons; showing a decrease for 1865 of 23,164 tons.

In charcoal pig iron there seems to have been a slight increase; the figures being for 1864, 244,091 tons; for 1865, 252,390 tons; an increase of 8,299 tons.

On a review of the whole trade in its three above-mentioned divisions, it appears that 910,555 tons were manufactured in 1865, as against 1,130,280 tons in 1864, a falling off of 219,725 tons.

The rolling mills of the country turned out 833,049 tons in 1865, and 852,378 tons in 1864, showing a decrease of 19,329 tons.

Of the amount manufactured by these mills in 1865, 353,017 tons were in the shape of rails new and re-rolled, the mills having a capacity of 735,000 tons, double therefore their present production.

The steel manufacture of the country seems to suffer most injuriously from foreign competition and home taxation; 15,862 tons constitute the home manufacture. At the same time, 10,000 tons, or two-thirds, of the home production, were imported from abroad during the last fiscal year, and orders for 10,000 tons more have gone abroad within the last three months.

The consequence has been the stoppage of three establishments in New York.

* What this tax amounts to may be seen in the account of the proceedings.

A series of resolutions were then unanimously passed, cordially supporting the views of the Revenue Commissioners as to "the entire exemption of the manufacturing system of the United States from all direct taxation," and bearing generally upon the grievances of high cost of living and excessive taxation.

In the course of these resolutions it was observed that the wages of American labour were 200 and 300 per cent. higher than in Great Britain, and that the rate of interest for the use of money on a past yearly average was more than three times as great here than there, and that owing to the perpetual uncertainty of the revenue policy of the country investments in American manufacturing enterprises were thereby discouraged.

The whole tone of the meeting was strongly in favour of a protective policy until, in the words of the resolution, "their industry has reached the point of development where rivalry with the skill and taste of other nations equally or more developed, will be profitable as a stimulus to better work and to cheaper processes."

When it is considered that over 500,000 persons are in the employ of the iron and steel manufacturers, the necessity for arriving at some definite action on the subject becomes at once apparent.

The present Tariff rates on iron and steel vary, whether as regards specific or *ad valorem* duties, according to the nature of the manufactured article.

In the specific duties they seem to range from 1 up to 6 cents per lb., with in many cases an additional *ad valorem* duty of 15 or 30 per cent. as the case may be.

Pig iron, for instance, pays a duty of 9 dollars a ton.

Iron bars for railroads 70 cents per 100 lbs.

Common sheet iron from $1\frac{1}{4}$ to 3 cents per lb., according to the different gauges and finish.

Cast iron $1\frac{1}{2}$ cents per lb., and iron wire in their various sizes 2, $3\frac{1}{2}$, and 4 cents per lb., with an additional *ad valorem* duty of 15 per cent.

Iron cables $2\frac{1}{2}$ cents per lb., and so on through the list;—rates of duties which would appear to be high enough for all purposes of protection.

The *ad valorem* duties, bearing principally upon articles such as castors, scythes, shovels, spades, sickles, hoops, and filings range from 30 to 45 per cent.

The same may be said with regard to steel.

Steel, whether in the shape of bars, ingots, sheets, or

coils, according as its value may be, 7 cents or over up to 11 cents per lb., is taxed at the rate of $2\frac{1}{2}$, 3, and $3\frac{1}{2}$ cents per lb., with an additional *ad valorem* duty in the latter case of 10 per cent.

Steel wire, according to its different diameter and value, ranges from $2\frac{1}{2}$ to $3\frac{1}{2}$ cents per lb., with additional *ad valorem* duties of 10 and 20 per cent. All other kinds, such as plates, chains, sickles, knives, &c., bear an *ad valorem* rate from 30 to 45 per cent.

Notwithstanding such rates, amounting in many instances to more than 70 dollars a ton (2,240 lbs.), rates which affect not alone iron and steel, but nearly every branch of American commerce, the demand for foreign goods seems in nowise to be checked.

The aggregate income from Customs duties, all paid in gold, through the single port of New York, thus far in the current fiscal year commencing with July 1, 1865, is 90,205,621 dollars, or a monthly average of 11,275,703 dollars, equal to the large annual amount of 135,308,436 dollars, which would leave less than 46,000,000 dollars to be made up by the outports in order to realize an estimate of 180,000,000 dollars as the aggregate of the year's revenue from Customs duties exclusively.

I have, &c.

(Signed) J. HUME BURNLEY.

American Iron and Steel Association.

CONVENTION AT SEATON HALL.

YESTERDAY morning at half-past 10 o'clock a Convention of Representatives of the American Iron and Steel Association assembled in Seaton Hall, corner of D and Ninth Streets, for the purpose taking action for the protection of the interests of the iron and steel manufacturers of the country.

The Convention was called to order by E. B. Ward, Esq., President, of Detroit, Michigan; Henry Mc Allister, Esq., Secretary.

On motion, G. B. Stebbins, Esq., of Detroit, Michigan, was elected as Assistant Secretary.

The minutes of the last annual meeting, held in Philadelphia on December 13, 1865, were read by the Secretary, and approved.

The Chair then delivered the following address to the Convention :—

“ Gentlemen of the Iron and Steel Association,

“ You have assembled at the capital of your country for the first time since the organization of our Association.

“ You are here for the purpose of impressing your Representatives in Congress with the idea, so patent in all truly prosperous countries, that the legislation of a nation should be so framed as to guard and protect the best interests of its own citizens and friends against the adverse acts of legislation, or of the capital of other nations.

“ The experience of this nation, with prominent examples in Europe, of the operations of the two systems of protection and free trade, ought to relieve you of the burden of annual application to Congress to correct the errors of American legislation that have carried the business interests of this country from the highest state of prosperity to bankruptcy several times since its existence.

“ The great productiveness of the virgin soil of the United States has attracted millions of people to its cultivation, and the policy of the Government has been so shaped as to press other millions into the same employment, until the garden of the world finds itself burdened with untold millions of bushels of grain with no adequate market, either foreign or domestic.

“ This state of things has been long foreseen, and, while it is clear that wise legislation at an early day would have changed our position, it is our duty now to use our best endeavours to ward off the mischief that seems impending, and mitigate as far as possible the evils that a blind policy is now threatening.

“ All the great financial calamities that have afflicted this country have been preceded by large importations of foreign merchandize, the export of securities, and of our own precious metals, and it is lamentable to see the same unmistakable elements of depletion now in operation on a scale far greater than has ever before been known to exist in the history of any nation on earth.

“ The present discouraging features of our financial position are materially lessened by the great change that has taken place in public sentiment in the North-Western States during the past year. At least two-thirds of the Representatives from that section of country favoured the

free trade policy one year ago, but I have good reason to believe that a material change has taken place in the minds of many of their Representatives, and that they are now disposed to favour protection.

"The call for a protection meeting at Chicago last week, signed by nearly 5,000 persons, indicates an unmistakable earnestness among the people in favour of building up home interests. They say in their resolutions that infant manufactures are springing up in all parts of the North-West, and they ask Congress, in mass Convention, not to allow them to be crushed out of existence by European competition. They begin to understand that their only hope for an adequate market for their agricultural products must be in the West; and when the people so understand it, their Representatives will understand it too.

"Since our last meeting we have done but little in the line of distributing documents, that service having been so thoroughly done during the summer and fall months that it has not been deemed necessary to expend much money or effort in that direction during the winter.

"I have ordered the distribution of 20,000 of the very able speech of the Honourable Wm. Kelly, of Pennsylvania, and have visited many of the members of Congress with a view to ascertain their sentiments on the questions that most interest our Association.

"Our worthy Secretary will lay before you the financial condition of the Association, and will give you some of the results of his valuable labours in collecting the statistics of the iron and steel business of our vast country.

"Mr. G. B. Stebbins, who now resides in this city, has been of signal service in looking to our interests here, while Colonel Daniels and Mr. Norton have been active in their sphere in Illinois.

"Our auxiliary societies at Cleveland, Cincinnati, Ironton, Essex County, New York, and other points, have done their duty faithfully and well, and if we should succeed in enlightening the legislation of the country so as to produce steady and permanent prosperity amongst the working classes, we shall feel doubly paid for our time and expenditures in exposing the folly of a free trade policy, that brings unmixed evil to the inhabitants of any nation that adopt it.

"The fact that every rolling-mill but one in Pittsburgh is now idle is a sufficient proof that the iron interest is not

in a very prosperous condition at the present time, whilst our blast furnaces are accumulating large stocks of pig, with but little hope of an early market."

The Secretary then read the following Report, which was unanimously adopted :—

" Mr. President and Gentlemen,

" In reviewing the condition of any of the great manufacturing industries of the country, it is always more agreeable to report a continuance of prosperity and regular expansion. Unfortunately, however, in respect to the industry which we represent, we have but little to say that is satisfactory, and regret to have to acknowledge a great state of depression in the business of manufacturing iron and steel.

" In collecting the statistics of the iron and steel trade of the country for the year 1865, a duty toward which much of the time and attention of your Secretary has been directed since the last meeting of the Association in Philadelphia, a correspondence has been maintained with members of the trade in all parts of the country. This correspondence has elicited expressions of opinion, which, coming as they do from persons representing every branch of the business, and from every section of the country, are entitled to thoughtful and earnest consideration. They set forth at length the difficulties under which they are labouring, and the only condition upon which their works can be kept in operation, fully sustaining the views expressed by Vice-President Samuel J. Reeves to the late meeting of the Association. In discussing the condition and future prospects of the trade upon that occasion, he remarked :

" "The question arises, and should elicit the serious consideration of this meeting, whether manufactured iron can be afforded at lower than the present ruling rates. If not, then the American mills must either cease work or lower the wages of their employees. The margin for diminishing, however, is very small. It comes then to this, that wages must be reduced below the living rate of sustaining a good class of workmen, or the business of supplying the American market with rails and bar iron must be yielded to foreigners. There is one way by which this disastrous result may be avoided, and that is by increasing the duty on imported iron by Act of Congress. Our only security under high taxation and high cost of

living lies, therefore, in the expectation of procuring an alteration of the Tariff laws, and, perhaps, some abatement of the internal revenue tax upon iron.'

"In speaking of a return to specie payment, he remarked:

" 'This involves the necessity of increasing the duties on imported manufactures, a reduction of the internal revenue tax on iron and steel, or the cessation of our business and the dispersion of our working men.'

"These are the views entertained by the trade throughout the country, as expressed in nearly three hundred communications from persons representing many millions of dollars, and supporting thousands of families.

"The statistics of the trade for 1865 will show a material decrease in the production of iron compared with the Returns of 1865. For several months during the past year a majority of our rolling mills, forges, and furnaces, altogether or in part, ceased operation. This caused a temporary demand for iron, which resulted in a revival of the trade toward the close of the year, and many works resumed operations; owing, however, to the great cost of production, caused by the high price of labour and increased taxation, the products could not be sold at remunerative prices in a market regulated by a foreign supply. As a consequence, a large number of rolling mills in Pittsburgh and vicinity have ceased operations since the beginning of the present year. The proprietors of many establishments which have been standing idle since last summer express satisfaction that they were not tempted into starting their fires by the delusive promises of a remunerative trade held out last autumn.

"Your Secretary will now proceed to examine the effects of these adverse influences upon the production of our iron and steel works during the past year.

"The Returns of the anthracite furnaces of the United States for 1865 show a marked decrease in products, compared with the results of their operations during the previous year. Of the thirty furnaces in the Lehigh group, twenty-two are now in blast. In 1865 the production of this region amounted to 177,438 tons, being 36,665 tons less than in 1864. Two of the establishments in this group exhibit a falling off of 25,000 tons in their united production. During the severe depression in the trade last summer eighteen of these furnaces were blown out. Some of them resumed operations later in the year, but the

capacity of the region is still far in advance of its present production.

"In the Schuylkill group there are twenty-four furnaces, of which eighteen are now in blast. In 1865 this region produced 78,675 tons of pig metal, a decrease of 34,131 tons compared with that of the previous year. The present capacity of these furnaces is 143,150 tons.

"Of the thirty-two furnaces in the Lower Susquehanna group, nineteen are now in blast. In 1864 this district produced 118,615 tons, and in 1865 73,016 tons, a decrease of 45,599 tons. The region is capable of producing 170,800 tons.

"Of the twenty-nine furnaces in the Upper Susquehanna region, fourteen are now in blast. In 1865 these furnaces made 68,814 tons of metal, a decrease compared with 1864 of 38,150 tons.

"In the Eastern group we have a still greater falling-off to record. Most of these furnaces blew out in the spring of 1865, owing to the depression in business. Later in the year, when trade assumed a more cheerful aspect, the impossibility of getting coal sufficiently low to render the manufacture of iron remunerative, compelled them to remain idle during the remainder of the year. The furnaces in this group produced during the year 1865 81,615 tons, being 49,925 tons less than in 1864. The capacity of this region is over 200,000 tons per annum. Of the thirty-one furnaces comprising this group, only thirteen are now in operation.

"A comparison between the past two years shows the following result :

	Tons.			
" Total production of anthracite iron in the United States in 1864	684,018
Total production in 1865	479,558
				<hr/>
Decrease in 1865	204,460

"Or about 30 per cent. less than was made in 1864.

"The production of the raw bituminous coal and coke furnaces of the country exhibits also a marked decrease when compared with that of the previous year, as the following statement will show :

“Raw bituminous coal and coke pig iron made in—

	1864.	1865.	Decrease in 1865.
	Tons.	Tons.	Tons.
“In Pennsylvania	123,520	119,080	4,440
In Ohio	73,124	53,515	19,609
			Increase in 1865.
In West Virginia	3,880	4,400	600
In Maryland	1,727	2,012	285
Total of raw coal and coke pig-iron made . ..	202,171	179,007	
Decrease in 1865 ..	23,164 tons.		

“This decrease, as will be seen, is principally in the production of the Ohio furnaces, which exhibit a falling off of nearly 20,000 tons. The production of 1865 was the work of fifty-one furnaces, many of which, however, were in blast but a short time, and few, if any, were worked full time.

“The following is a statement of the production of charcoal pig iron in the country in 1865, and a comparison with that of 1864, by which it will be seen there has been a slight increase during the past year :

States in which Produced.	Production in 1864.	Production in 1865.
	Tons.	Tons.
“New England	23,759	27,500
New York	25,111	24,435
New Jersey	2,131	2,686
Eastern Pennsylvania	43,806	50,746
Western Pennsylvania	9,862	7,222
Maryland	19,604	19,447
Ohio	70,080	71,940
Kentucky	11,942	9,297
Michigan. . . .	19,405	22,224
Missouri	16,544	14,511
Wisconsin	1,927	2,262
Total	244,091	252,390
Increase in 1865	8,299

“The total production of pig iron in the United States, as shown in the foregoing statements, is as follows :—

	Tons.
“Anthracite	479,558
Raw bituminous coal and coke	178,607
Charcoal	252,390
Total	910,555

"The iron trade of the Lake Superior region exhibits, in the shipment of ores, the effects of the depression that rested upon the trade during the past year. In 1865 there were shipped by the several Companies, including the shipments to Escanaba, 178,708 tons of ore; being about 70,000 tons less than were shipped from the region in 1864.

"The following statement exhibits the production of the forges and bloomeries throughout the country in 1865. Our information is not sufficiently full to enable us to separate the amount of blooms, bars, and other forgings made direct from the ore and the amount made from pig and scrap iron. The total is as follows:—

					Tons.
" New York	19,717
Pennsylvania	32,528
Other States	7,572
Total					59,817

"Our Returns for previous years are as yet too imperfect to enable us to draw a comparison with proper accuracy. It is believed, however, that the above statement exhibits a material falling off as compared to the production of 1864.

"The product of the rolling mills of the country in 1865 is as follows:—

	Tons.		Tons.
" New England	.. 102,802	" Missouri	.. 10,198
New York..	.. 102,177	Michigan	.. 8,784
New Jersey	.. 41,014	Illinois	.. 32,120
Pennsylvania	.. 388,436	Indiana	.. 18,748
Delaware 4,334		
Maryland 21,835	Total in 1865	.. 833,049
West Virginia	.. 19,721	Total in 1864	.. 852,378
Ohio 61,810		
Kentucky 14,551	Decrease in 1865	.. 19,329
Tennessee..	.. 6,522		

"Of the total product in 1865, 353,017 tons are rails, as follows:—

	Tons.		Tons.
" Massachusetts, two mills	.. 30,442	" Kentucky, two mills	.. 7,326
New York, five mills	.. 52,316	Indiana, one mill	.. 18,745
New Jersey, one mill	.. 4,320	Illinois, three mills	.. 32,120
Pennsylvania, fourteen mills	.. 163,894	Michigan, one mill	.. 8,784
Maryland, two mills	.. 5,500	Tennessee, one mill	.. 6,522
West Virginia, two mills	.. 1,000		
Ohio, three mills	.. 22,048	Total of rails, new and rerolled	.. 353,017

"These mills have a capacity of 735,000 tons of rails per annum, or about double their present production.

[187]

2 F

“ The following is the production of the steel works of the country during the year 1865 :—

	Tons.		Tons.
“ Massachusetts ..	1,629	“ Pennsylvania ..	10,541
Connecticut ..	150	Michigan ..	200
New York..	1,304		
New Jersey ..	2,038	Total of all kinds ..	15,862

“ The steel manufacture being comparatively a new business in this country, has felt the injurious effects of foreign competition and increased home taxation very sensitively. Three establishments in the city of New York have recently suspended business, while few of our works are producing more than half their capacity. During the fiscal year ending June 30, 1865, nearly 10,000 tons of steel were imported, or about two-thirds as much as the total production of the country last year. Since then the importation has increased, and we are assured by those who are cognizant of the fact, that orders for at least 10,000 tons of steel have gone abroad during the last three months. It is not surprising, then, that English makers are calculating upon doing a heavy trade with this country in steel during the present year.

“ Efforts have been made to ascertain the number of persons supported by our works in the manufacture of the various kinds of iron and steel enumerated. Full Reports as yet have not been received from all. We believe, however, that we are not overestimating the number, including those directly engaged in providing fuel for the works, at from 450,000 to 500,000 persons.

“ The following is an estimate in detail of the internal revenue derived from the manufacture of iron and steel during the fiscal year ending June 30, 1865 :—

"IRON.

	Duty per Ton.	Revenue.
	Doll. c.	Doll. c.
"Iron advanced beyond blooms, slabs, or loops, but not beyond bars ..	3 60	457,622 35
Iron band, hoop, and sheet not thinner than No. 18 wire gauge ..	3 60	229,178 86
Iron band, hoop, and sheet thinner than No. 18 wire gauge ..	6 0	89,963 11
Iron bars, rods, &c., made from iron on which a duty of 3 dollars per ton has been paid ..	2 40	30,474 65
Iron blooms, slabs, or loops, when made in forges or bloomaries directly from the ore ..	3 60	52,158 55
Iron castings used for bridges or other permanent structures ..	3 60	89,743 25
Iron castings, not otherwise provided for, exceeding 10 pounds in weight ..	3 60	708,458 34
Iron, cut nails and spikes ..	6 0	328,940 20
Iron, pig ..	2 0	1,193,326 67
" " ..	2 40	291,056 15
Iron, plate, not less than $\frac{1}{4}$ inch thick ..	3 60	120,871 78
Iron, plate, less than $\frac{1}{4}$ inch thick ..	6 0	29,420 25
Iron, railroad ..	3 60	284,783 48
Iron, railroad, re-rolled ..	2 40	376,264 47
Iron rivets exceeding $\frac{1}{4}$ inch in diameter, nuts and washers not less than 2 ounces each in weight, and bolts exceeding $\frac{1}{4}$ inch in diameter ..	6 0	33,650 66
Iron rivets, nuts, &c., made from iron on which a duty of not less than 3 dollars per ton has been paid, in addition ..	2 40	22,847 05
Iron stoves and hollow-ware ..	2 60	211,848 65
Iron advanced beyond pigs, blooms, &c., the duty to which it was liable in the form of pigs, blooms, &c., not having been paid in addition ..	3 60	215,375 82
Iron, wrought railroad chairs, railroad, bolt, and ship spikes, and tubes made of wrought-iron ..	6 0	5,694 42
Iron, manufactures of, not otherwise provided for ..	\$6 per cwt.	3,723,310 24
Total revenue from iron	8,494,988 95

"STEEL.

	Duty per Ton.	Revenue.
	Doll. c.	Dolls c.
"Steel in ingots, bars, sheets, or wire, not less than $\frac{1}{4}$ inch thick, and not over 7 cents per pound in value ..	6 0	4,340 06
Steel in ingots, bars, &c., over 7 cents and not over 11 cents per pound in value ..	12 0	12,766 92
Steel in ingots, bars, &c., over 11 cents per pound in value ..	15 0	156,266 70
Steel, rolled or sheet, rod or wire, made of steel on which duty has been paid ..	\$6 per cwt.	678 86
Steel manufactures not otherwise provided for ..	\$6 per cwt.	549,767 14
Total revenue from steel	723,819 68
Total revenue from iron and steel	9,218,808 63

"The following statement exhibits the quantity of iron and steel of various kinds imported into the country during the fiscal year ending June 30, 1865 :—

IRON.

	Quantities.	Value.
		Dollars.
"Iron, pig Tons	44,601	694,097
Bar iron in flats, less than 1 inch and more than 6 inches wide, &c. .. "	8,816	412,470
Bar iron in flats, not less than 1 inch and not more than 6 inches wide, &c. .. "	31,696	1,760,997
Railroad iron "	74,702	2,806,618
Boiler and other plate Lbs.	513,519	21,554
Sheet iron, common "	7,276,035	209,000
Sheet iron, smooth and polished "	2,214,991	163,183
Band, hoop, and scroll iron "	7,324,941	188,940
Locomotive tire "	3,466,558	210,385

Ditto, value over 11 cents per lb. ..	848,134	107,164
Steel wire	139,060	37,543
Files, rasps and floats	1,021,158	311,781
Total of steel, tons of 2,240 lbs. ..	9,576	1,778,788
Total of iron and steel imported ..	202,033	8,959,628

"It may not be improper in this connection to take a brief review of the iron trade abroad. In England it would appear that business throughout the year has, upon the whole, been satisfactory. During January 1865 the demand for iron was quiet and but few works were fully employed. In February, March and April, business was somewhat embarrassed, particularly in North and South Staffordshire, by strikes of the puddlers, which ceased towards the end of May. In the beginning of June the demand was steady, but towards the close of the month the failures in the East India trade, creating a general distrust, kept orders back, while the American demand was light. In August the trade began to improve, orders arriving by every mail. In September the trade was well supplied with orders, some being full for a month in advance. At some of the works there were orders coming in from America of something like the character they were prior to the war. Toward the close of the year the demand was unusually steady, the works were in fair operation, orders from the United States continuing to arrive by every mail.

"Since the beginning of the present year business has been exceedingly satisfactory. Reports from all the iron districts in England represent the greatest activity in the trade. Advices to the effect that foreign stocks are light inspire confidence in the future, notwithstanding many expressions of fear that the present Congress of the United States may legislate adversely to British interests here. 'If,' says a writer from South Staffordshire to the editor of the London 'Mining Journal,' 'Mr. Bright's recent letters to the free traders of America have the effect of opening the eyes of the people there to their interests, we

may expect a great demand for iron from the States this year.' In the neighbourhood of Sheffield the iron and steel manufactures continue busy, and for heavy goods there is an increase for home and foreign consumption. The armour-plate mills are busy with Government orders. Rails are in great demand for the East India trade. In South Wales the furnaces and mills are in active operation.

"The Scotch iron trade in 1865 manifested a healthy progress. The production of pig iron amounted to 1,164,000 tons, of which 531,500 tons were consumed in local foundries and malleable iron works. At the close of the year there were in Scotland 165 furnaces, 136 of which were in blast. The fluctuations in prices during the year ranged from 50s. to 65s. 6d., giving an average of 54s. 9d. per ton. Since the beginning of the present year prices have rapidly advanced, owing to the heavy purchases of speculators, principally from Liverpool, in anticipation of high prices ruling throughout the year. Toward the close of last month 62s. 3d. per ton was obtained; since then prices have slightly receded. The makers of manufactured iron complain of the profitless nature of their business with pig iron at its present price.

"In France, the production and manufacture of iron is assuming an important position among her industrial pursuits. Large and rich deposits of iron ore have recently been discovered on her eastern frontier, and their exportation has already become very considerable. In 1865, there were produced as well of pig, for refining, as of second fusion casting pig, 221,200 tons charcoal, 848,300 tons coal, and 98,800 tons charcoal and coal mixed, making a total of 1,168,302 tons pig metal. On comparing the results of last year with those of 1860, it will be seen that in five years the total production of charcoal-made pig has fallen from 316,400 tons to 221,200 tons, while, on the other hand, the make of pig metal made with coal alone or mixed with charcoal has risen from 581,800 tons to 947,100 tons. It follows that comparing 1860 with 1865 there was an increase of pig generally, in the latter year, of 272,100 tons. The iron-works of the country are well employed, having large orders for rails, castings for bridges, and armour plates for shipping.

"Since the last meeting of the Association in Philadelphia, nineteen contributing and five honorary members have been added to our roll. The names of the latter are

Hon. Andrew G. Cartin, of Pennsylvania; Hon. Joel Parker, of New Jersey; Hon. F. H. Peirpoint, of Virginia; Hon. Stephen Miller, of Minnesota; Hon. Addison C. Gibbs, of Oregon. We have now 237 contributing and 25 honorary members.

"Our finances are in a satisfactory condition. Since the beginning of the year 6,500 dollars have been received, being assessments upon the production of our works during last year.

"Before closing this Report your Secretary feels it a duty to acknowledge his obligations not only to the members of the Association, but to many gentlemen in all parts of the country, representing every branch of the trade, for the prompt and cheerful manner in which they have furnished the facts which have been hastily condensed and embodied in this Report. In answer to communications addressed to the proprietors of each of our furnaces, mills, forges, and bloomeries, requesting information concerning the result of the operations of their works during the past year, over a thousand letters have been received, all of which are characterized by courtesy and a cheerful acquiescence to our request. The value of correct statistics in determining the exact condition, not alone of the particular interest which you represent but of every native industry, must be evident to all. They furnish the means by which we can readily perceive the beneficial result of a wise national policy which seems to foster American interests, and the injurious effects of an opposite policy which seeks their overthrow.

"Respectfully submitted.

"HENRY McALLISTER,

"*Secretary pro tem.*"

"*Note.*—In a few cases returns were not made, and therefore estimates made of the products of some works, which will be found nearly correct."

On motion, a Committee was appointed to draft resolutions, to be reported at the evening session of the Convention.

A member from Cincinnati, Ohio, reported that a Home Labour League had been formed in Cincinnati by those interested in the manufacturing of iron and steel. They worked upon the same basis as the Association here represented, and had issued a large number of documents on the iron subject. The Secretary of the League was

engaged in collecting information and meeting the arguments of free trade advocates.

Mr. John W. Nystrom, of Pennsylvania, here illustrated his improved pneumatic process for refining iron, a patent for which he has recently taken out.

On motion, the thanks of the Convention were voted to Mr. Nystrom for the satisfactory manner in which he explained the workings and effects of his patent.

Mr. Oliver D. Barrett, of Colorado Territory, was here called upon, and gave an account of the vegetable and mineral resources of the territories of Colorado and Nevada, which was highly flattering to those territories and interesting to the Convention. He pictured that section of the country as being exceedingly rich in minerals, and asserted that as much as ninety bushels of wheat had been raised there on an acre of land. It also abounded in buffalo grass, which fattened cattle equally as well as they would fatten on grain in this section of the Union. Sheep in large numbers were raised there, and yielded an immense profit to graziers. The eastern slope of the Rocky Mountains—embracing an area greater than all of New England, New York, and Pennsylvania—was rich with minerals, at least one-fifth of that being mineral land.

Many men, he said, went there poor, and soon amassed immense fortunes. That territory paid about 120,000 dollars of internal revenue for the past year, or about one-third of what was paid by the largest State in the Union. Gold and silver abounded in large quantities; and, in the last three months, the gulches yielded more than they did in the preceding six months. The number of lodes already discovered was about 5,000, averaging 155 dollars to the ton, and he had seen them yield 5,000 dollars to the ton. By a calculation he found that the lodes would produce 150,000,000 dollars, sufficient to buy the country, with a surplus to carry it on. Wrought-iron nails were disposed of there at 1 dollar per lb., and wheat brought 6 dollars per bushel. He believed that at least 150,000 tons of iron would be consumed there yearly, and the Northern Pacific Railroad would, he thought, pass through the richest portions of this country in the course of five years. On the Norwegian Creek some very fine specimens of iron ore had been discovered; besides this, there were thousands of acres of heavy timber that could be cut as cheaply as here; there was an abundance of

limestone, some oil, a spring of which, a short distance south, yielded daily about fifty barrels. He also found there copper of various kinds, besides lead. There were millions of tons of copper on the top of the ground, which could be picked up as could granite in New Hampshire.

What the manufacturers wanted here, the speaker said, was a higher protective tariff, say 10, 15, or 20 dollars per ton to protect their interests. In his country they had a protective tariff of about 200 dollars per ton, and it could not be less than 100 dollars per ton in the next five years—up to the time the Northern Pacific road would reach that country. He favoured the idea of a company organizing with a capital of 250,000 dollars, and commencing work at once in that region, which would control the business and yield many millions of dollars in the coming five years. Miners could live there, he said, on 1 dollar per day.

The speaker said that the farmers there state that 1,000 acres of land can be taken up, fenced, ploughed, seeded, and harvested for 50,000 dollars, including the cost of the necessary stock, farming implements, buildings, &c., and that 1,000 acres will yield 30,000 bushels of wheat worth 5 dollars a bushel, making the whole crop worth 150,000 dollars, yielding a profit the first year of 100,000 dollars on an investment of 50,000 dollars, with an excess to be carried to the credit of the next year, of land fenced and broken, the buildings, implements, and stock.

A vote of thanks was here tendered to Mr. Barrett, when

The Convention adjourned, to meet at half-past 7 P.M., in the same hall.

Evening Session.

Mr. Ward, the Chairman, at half-past 7 o'clock P.M., called the Convention to order, and Messrs. McAllister and Stebbins acted as Secretaries.

The Committee appointed at the morning session to prepare resolutions was called upon, and reported the following, which were unanimously adopted:

Resolved—That the American Iron and Steel Association has been formed, not in the interest of capitalists and employers, but in the interest of the labour of our whole country; that we believe in the harmony of interests between capital and labour; that they prosper only toge-

ther, and together must suffer—that their destinies cannot be and should not be dissevered; that we believe in the harmony of interests between manufactures and agriculture, and between production and commerce; that we believe that American capitalists, employers, labourers, and transporters are copartners with each other and with their Government, and that we deprecate as wicked and unpatriotic all endeavours to introduce discord into this community of interests by false teachings; that legislation for the benefit of all is designed for a class, and that the relations between these copartners are not always those of mutual good, but in their nature are antagonistic.

Resolved—That this Association feels that it is due to the national interests, and due to the wisdom, assiduity, and thoroughness with which the Commissioners appointed to revise the internal revenue system of the United States have done their work, to express our appreciation of the great value of their labours, and our approval of the suggestions contained in their Report, and especially of their statesmanlike indications of the true and only remedy for the ruinous want of equalization between the tariff and the excise, which they in terms say “they are unhesitatingly prepared to recommend,” “the entire exemption of the manufacturing system of the United States from all direct taxation.”

Resolved—That this Association, composed of men engaged in, and practically familiar with, many of the industrial pursuits whose interests have been studied and reported upon by the Internal Revenue Commission, respectfully urge upon Congress the speedy adoption of their several recommendations of remedial changes, as being founded in a positive knowledge of the influence of our customs and excise systems upon the labour of the country, and as being, in our judgment, practically adapted to cure the many evils which do now seriously retard or wholly suspend the production of wealth by the American people.

Resolved—That the internal stability and political power of nations, their perfection in agriculture, the growth of their commerce, and their accumulation of wealth—in a word, their civilization—proceeds from the general and profitable employment of their citizens in diversified industry; and that among the objects for which government is established among men, chief of all is the systematic and continuous protection of that industry by law until it

has reached the point of development where rivalry with the skill and taste of other nations, equally or more developed, will be profitable as a stimulus to better work and to cheaper processes.

Resolved—That unrestricted and untaxed domestic trade is the policy of the States of the American Union ; but that international free trade between these States and older and richer foreign States should only be arrived at through protection ; and that our Government in conducting the development of the resources and labour of the country to that end, should be guided by the wise policy of the British, who with extreme jealousy and rigour protected their manufactures and the commerce which grew out of them for an unbroken period of over 200 years ; and that the bankruptcy, waste, impoverishment, and suffering which four times in less than half a century have cursed the American people as the punishment of their trial of international free trade before they were prepared for it, should suffice as a warning against a repetition of the deadly error.

Resolved—That we favour, and that we will welcome the unrestricted emigration from all the world of skilled and unskilled labour, and of manufacturing capital and experience.

Resolved—That there is a struggle between American labour and British capital for the possession of the American markets, which should command the immediate intervention of our Government and the anxious sympathy of all our people ; that this struggle is unequal, for the reasons that the British nation is in possession of the markets of the world through the enormous development of its manufactures and commerce ; that its manufactures are superior to those of all other nations in the advantages of accumulated wealth ; the control of money without limit at low rates of interest ; an abundance of cheap skilled labour, whose wages are but a third or a quarter of what American working men properly demand and justly receive ; in the proximity of their mills and factories to inexhaustible supplies of iron and coal ; in the complete exemption of their manufactures from taxation, and the additional Governmental protection of free trade in raw material. On the other hand, the wages of American labour are 200 and 300 per cent. higher than in Great Britain ; the rate of interest for the use of money, averaged through a period of years, is more than three times as great here as there ;

the perpetual uncertainty of the revenue policy which hangs over American manufacturing enterprises discouraged investments; the extent of our country and the separation of its labour from materials and markets enhance the cost and diminish the profits of production, and the war to save the nation's life left behind it heavy taxes, which enter with the elements of every product of skill, and crown the finished result with a fresh addition to the cost, and give large premiums to importations from abroad.

Resolved—That our present tariff is insufficient to give American labourers equality in this unjust and unnatural struggle to wrest from them the possession of their own markets, and to take from them their right to do their country's work.

Resolved—That the truest plan of reconstructing the South and restoring the Union, is to establish permanently a national revenue policy, which shall develop the coal, iron, gold, copper, petroleum, and other mineral wealth of Virginia, Georgia, the Carolinas, Kentucky, Alabama, Tennessee, and their sister States; vary and enrich their agriculture, and plant manufacturing cities upon their heretofore wasted water powers, and save them for ever from the pauperization and inferiority which eternally attach to the exportation of raw products and the importation of goods, and give them that prosperity and content that deprive politics of animosity, and take from sectional strife its object.

Resolved—That we see in the enormous and unprecedented importation of foreign goods bought on credit, as well as shipped here upon adventure, in our vast indebtedness to Europe upon Federal, State, corporate and municipal bonds, in the steady growth of our necessity to part with our gold, in the rapid diminution of the consumption of coal, which is the bread of manufactories, in the alarming increase of rents in the principal importing city of our foreign trade, in the fall of prices of railroad and other property of acknowledged value, in the diminished operations of most of our manufactories, and the suspension of many the consumption of whose products is the measure of the health and vigour of national life, the near approach of one of those financial and industrial crises which have so often swept over our country in punishment for its violation of the laws of true economy, and we call upon Congress to avert the disaster by speedily passing laws to relieve our labour from domestic taxation, to protect it

from unequal foreign competition, and to retain our money in the country by making it more profitable to buy at home than abroad.

Resolved—That much of the labour of the nation, deflected from its natural channels by the rebellion, is now seeking its accustomed employments, and gratitude and justice demand it should find them; that, as of right, to the operatives of a nation belongs the field of labour necessary for the supplying of its wants; where the material for the supply of those wants exists, it is the duty of the Government to secure that labour to the people of the United States; that the policy which gives to the workmen of foreign nations the supplying the wants of this nation is robbing the American mechanic and labourer of that natural right. By such a policy the brave men who have so freely given their blood and risked their lives in maintaining the Government, and who are now seeking employment, are left to beg from door to door for their labour, which makes rich those who aided in the endeavour to destroy the Republic. The Government should be true to those who were true to it, and protect those in their labour who protected it in its peril.

Dr. William Elder, of the Treasury Department, was here introduced to the Convention, and, among other things, said Pennsylvania was just the place to learn the sound truth of the industrial policy. Philadelphia was the centre and the Second Ward was the great representative of the industrial interests. The speaker said he had friends who were ready to embrace anything that savoured of free trade. Free foreign trade made men here slaves. Not an ounce of wool or anything in the way of trade should be permitted to leave our shores until it has received the last industrial touch by our manufacturers. In speaking of the Cobden Treaty of 1860 he said it was more protective than was the Morrill Tariff, and the Tariff here might be doubled before it would equal the Anglo-French Treaty Tariff. The French system he pronounced a fraud, a mischief, and a folly, and contended that we could have no market for our wool and other products in foreign countries. He knew a man, John Brown, who took 60,000 pounds of wool from Washington, Alleghany, and other counties in Maryland, and set sail for England. When he arrived there they offered him only 40 cents per pound for his wool, saying they could not make anything more than middling goods of it. They could not work it. He then

went to Germany, and they could not work it there, so he brought it back and sold it in one of our Northern cities. The fact was, they could not compete with this country if our interests were properly attended to. We understood defending our soil and our flag, but we did not understand defending our industry and commerce. The time had nearly come, when the late war broke out, when we would have experienced another financial crisis. But it has proved that a burdensome national debt has become a national blessing to us, as we then had a good pretext to withdraw specie from circulation.

The resolutions just adopted covered the whole work, and if the matter was to be argued, it was only necessary to read carefully those resolutions to find food for argument.

Honourable Green Clay Smith, of Kentucky, being called upon, announced himself as in favour of fostering American industry. He said he had been led into the views he held on this subject by the circumstances of the country. Our resources were so vast that there was ample room for the employment of all our own people, and for all who may come here; and it was our policy to attract the labourers necessary for the development of our resources and for the supply of all our wants to our own shores, rather than to feed them in Europe. He had no especial regard for the iron manufacturers in particular, but thought the protection of their business was in reality the protection of the labourers employed by them. After speaking of the magnificent natural advantages enjoyed by his own and other States, which only needed proper legislation to enable us to build up everywhere successful manufactures, he concluded by saying that so long as he should hold his seat in Congress he might be relied upon as a friend to the protection of American industry.

Honourable Simon Cameron, of Pennsylvania, next addressed the Convention. He said the subjects in relation to which this body had assembled had attracted his attention from the earliest period of his public life. As a journalist, the first article he ever wrote was on the subject of protection to home industry. At the commencement of the war of 1812, there was not a single woollen factory in the country, and when the foreign supply was cut off by the war, the Government was reduced to such straits to procure blankets for the soldiers that it was necessary to gather up old rags all over the country to serve as a substitute. And at the commencement of the civil war just

ended, our manufactures were so deficient that for a time we found it necessary to send all over the world in search of blankets, clothing, and fire-arms. But the effect of both these conflicts was to give a new stimulus to home industry, by showing us the necessity of relying on our own productive powers.

Our circumstances, he argued, were so different from those of the nations of Europe that the theories of political economy adopted there were not suited to our circumstances. He here spoke of the steady, rapid increase of our population, and the still greater increase of our wealth, as elements that must enter into our system of political economy, and particularly showed that this fact would render the payment of our public debt, large as it now appears, comparatively easy. He was not in favour of any attempt to pay it off at once (applause). It was only necessary to protect the manufacturing interests of the country, and our increasing prosperity would enable us to meet all our financial obligations with ease.

Pennsylvania, he said, was one of the earliest States to turn her attention to manufactures, and he instanced her growth, wealth, and industrial prosperity as illustrations of the advantages to be derived from fostering such enterprises throughout the country. His motto was, "Take care of the labouring population, and they will take care of the country." Heretofore the manufacturers had always been afraid of asking too much in the way of protection, and for that reason had not asked enough; but now he would say to the members of the Association, "Ask Congress to give you what is right, and they will give it to you, for you are a power in the land."

Mr. G. B. Stebbins spoke next. He had been travelling on business connected with the interests of the Association for several months past in the States of the great North-West. A few years ago the great majority of the people in that section were the advocates of free trade; but their views on this subject had undergone a change. They were beginning to understand that to insure their prosperity the farm and the factory must be located side by side, and that no matter how much they might increase the avenues of communication between the West and the East, that increase could never keep pace with the growth of the increase of production, and the increased transportation needed through the system of getting all their manu-

factured goods from distant localities in exchange for agricultural products.

There were but few persons in this Convention, but they were representative men, and it was as such that they could justly ask attention to their claims; for behind this little company he could see hundreds of thousands of labourers, and this was the fact from which he derived his earnestness in the cause. He here drew a contrast between the labourers employed in the iron manufacture in the United States and those employed in the same business in England, and showed that without protection the tendency would be either to put a stop to the business, or to reduce the wages of American labourers to the level of those obtained by their English competitors.

The question to be decided by Congress in fixing the Tariff was whether wages should be so reduced, or whether they should be maintained at the present standard, or even increased; and this he regarded as one of the most vital questions of the present time. He contended that our country, while superior to every other in respect of natural advantages, is behind them all in the care she takes of those advantages. England, Germany, and France, notwithstanding all we hear about free trade, guard the interests of their people by legislation, and contrive to prosper in spite of their poverty of resources and the prodigality of their Governments.

Honourable James K. Moorhead, of Pittsburgh, was next called upon. He said he had heard here to-night the true gospel of political economy. It was laid down in the resolutions; these were the text, and from that we had been treated to some very good sermons in the speeches made. The country that protects its labour will grow rich—if we only act on this principle, the development of the resources of our country must prosper. Although he represented an iron region, he was not disposed to ask protection for iron manufactures alone, but for American industry as a whole. In conclusion he would remark with Mr. Smith, of Kentucky, that so long as he remained in Congress he might be counted upon as a friend to the objects of this Association.

Mr. Robinson spoke next. He had spent the last four years in Washington territory, on the Pacific coast. After speaking of the vast natural wealth contained in the mines and forests of that region, he urged the importance of remembering those States in framing our legislation.

A resolution was here offered, and adopted, that the Chair appoint a committee to wait on the Congressional Committee on Manufactures and the Committee of Ways and Means. The following gentlemen were accordingly appointed; Messrs. Bennett, Cooper, Herron, and Banks, of Pittsburgh; Messrs. Reeves, Moorhead, Townshend, and McAllister, of Philadelphia; Mr. Green, of Cincinnati, and Mr. Morrell, of Johnstown, Pennsylvania.

Honourable R. S. Hale was next called upon, and said that as a representative of a district interested in the protection of American manufactures, he could entertain but one sentiment in reference to the object of this Association. He understood that there is no discrimination under the present revenue laws in favour of home industry, but rather on the other side, and that the nation presents the strange spectacle of offering a bounty to foreign labour as against our own. He showed that with all that is said of the advantages of free trade by European political economists, the leading nations of Europe shape their legislation so as to protect their own industry and make others pay tribute thereto; and it is our duty so to shape our legislation as to give our own labour the preference over that of foreign nations. He hoped that this Association would be the agent to lay before the country such facts and figures as would explode the doctrine of free trade and lead to the establishment of a truly American system.

Mr. F. Bruno, of Pittsburgh, offered the following resolution, which he thought was necessary to prevent the possibility of any misunderstanding of the position of the Association arising out of one of the resolutions previously adopted.

Resolved,—That the members of this Association, in expressing approbation of the recommendation of the Revenue Commission on the subject of fostering the wealth-producing manufactories of the country as a means of increasing the ability of the Government to meet its obligations, do not mean to express any unwillingness to bear their full share of taxation for the national expenses, and the interest on the national debt. On the contrary, we pledge ourselves to the last dollar to the maintenance of the national credit and integrity, only desiring that just legislation which will enable all the people to bear easily the common burden.

Adopted unanimously.

The President of the Convention thought it due to the

[187]

2 c

Association to say that, in all their efforts and all the publications issued by them, they had laboured not for the interest of iron and steel manufactures alone, but for the interest of all branches of manufacture.

Honourable Mr. Bundy, of Ohio, being called upon, said he thought he represented a district interested in the objects of this Association, and while he held his seat in Congress he might be looked for among its friends. He then spoke of the importance of such legislation as would enable the manufacturing States to enter into successful competition with foreign countries in the supply of the southern market, where he held that we might expect a largely-increased demand under the new system of labour. He urged the necessity of prompt legislation to check the immense importations from Europe which are now taking place.

A motion to call upon the President of the United States and present the resolutions adopted by this body was, after some discussion, unanimously carried: and on motion of Mr. Hale, a committee was appointed to wait upon the President at as early an hour as is convenient and ascertain at what time it will be convenient for him to receive the members of the Convention in a body.

It was moved and carried that the next quarterly meeting of the Association be held in Philadelphia, unless the President should deem it expedient to appoint some other place previous to that time.

The Convention adjourned at about 10 P.M.

Belgium.

*Report by Mr. Barron, Her Majesty's Secretary of Legation,
on the Cattle Plague in Belgium.*

Mr. Barron to Lord Howard de Walden.

My Lord,

Brussels, January 22, 1866.

As a subject of vital importance at the present moment and as one coming within the scope of Earl Russell's Circular of 1860, I have the honour to submit, for my yearly Report, the following observations on the cattle plague in Belgium:—

Section A.—*Nature and Progress of the Disease.*

1. The contagious cattle typhus, otherwise called rinderpest, or steppe-murrain, was *introduced last August into Belgium*, and broke out in six different provinces. The measures taken to master it having proved completely successful, may perhaps be studied with advantage in the present emergency. The main features of the disease were the same here as elsewhere, viz., a dull and motionless attitude; the back arched with the legs converging under the body; a peculiar expression of the eye; discharge from the eyes, nose, and mouth; suspended rumination; panting, moaning, trembling, diarrhoea; cessation of milk, extreme weakness, and prostration. The respiratory system seems to have been less attacked here than in England. The sub-cutaneous emphysema and pustular eruptions were generally absent. All the disorder seemed to be centred in the digestive organs. Enlargement of Peyer's glands is a distinctive and invariable internal symptom of the cattle typhus. The term of incubation, viz., that during which the disease remains latent, formerly held not to exceed nine days, has been found to extend to fifteen, twenty, and even to twenty-two days during the present epidemic.

2. *It is now half a century since the cattle plague has*

2 G 2

visited Belgium. It appeared here for a short time in the track of the Russian and Austrian armies about 1814, but was not allowed to take root. The Dutch Province of Utrecht alone became for a short time a seat of infection. The Southern Provinces of Russia, especially the banks of the Dnieper are, if not the birthplace, at least the constant home of this disease. It has always been traceable to and is only endemic amongst the great breed of the steppes. It was imported into Germany and France by the Austrian armies in 1795, spread from thence into Belgium, and committed great ravages here at the end of last century. Wherever during war Russian or Austrian parks of cattle followed the movements of armies, the cattle plague appeared and spread gradually over the adjacent countries. Thus in Turkey, Poland, Hungary, and the Crimea, it followed the track of the Russian armies.

3. This is certainly the most fatal and the most contagious of all maladies which attack domestic animals. The *ravages which it committed last century* in Europe are difficult now to believe. It made four inroads into Western Europe, and Belgium escaped none of them. In 1711 it was imported into Italy, and from thence overran the whole of Western Europe in less than four years, carrying off 1,500,000 cattle. In 1740 a new invasion caused still greater ravages, and lasted till 1757. In Belgium the mortality was so great that in order to preserve what few cattle had survived, an Ordinance of 1766 prohibited the export of cattle, and the slaughter of calves and heifers. Holland suffered still more severely than Belgium.

4. This was the period of the *principal outbreak in England, which lasted from 1745 to 1757.* It was nearly a year before the country became sufficiently aroused to take national measures for its repression, and these measures then came too late. They were of the same nature as those now practised in Belgium, the first of all being to kill all infected animals, and to bury them with slashed hides 10 feet deep under 4 feet of lime. The movement of cattle was also prohibited, except for immediate slaughter. The disease was thus extinguished in many counties, but lurked in others where the local authorities had been lax. The mortality in England must have amounted to many hundreds of thousands. Cheshire alone lost 30,000 head in nine months. Wherever the traffic in cattle was prohibited, the disease gradually subsided, but it broke out again when the restrictions were removed or evaded. The

discretionary powers given to local authorities were not exercised generally, promptly, and firmly. The plague was extinguished where the local authorities acted with vigour, but lingered in other places, whence it spread, after a time, as rapidly as ever. All justices were not equally firm, equally ready to do an unpopular thing, equally convinced of the magnitude of the calamity.

5. *In 1768 the plague made a third inroad into Western Europe not less disastrous than the former ones, and did not spare Belgium.* This time the local Governments of the Austrian Netherlands, taught by experience, took summary measures to root it out, and thus reduced the losses to a total of 12,000 head, while one Canton of Bruges, which refused to apply these measures, lost 6,000 head out of 25,700, and Holland lost 395,000.

6. *This form of disease, like every other, varies in intensity according to circumstances, but always kills the greater number of the animals which it seizes on.* The cattle of the steppes alone form an exception to this rule, and may recover in a proportion of 50 to 75 per cent. This is not the case with other species more artificial in their breed and habits. The number of recoveries among these cannot be estimated, except towards the decline of the epidemic, at more than from 10 to 20 per cent. In Poland during a succession of visitations between 1848 and 1855, the cures did not attain 20 per cent. The plague which in 1863 visited Hungary, Galicia, and Moravia carried off in each country 65, 77, and 88 per cent. respectively of the animals attacked. It is impossible to estimate accurately the mortality of the present plague in England and Holland. It is certainly at least in England not less malignant than any on record; but seems to have lost some of its virulence in coming over to Holland.

7. The importation of the cattle plague into England is involved in some obscurity, but is traced with probability to a cargo of 321 beasts imported from Revel to Hull in May 1865. Another theory ascribes it to some Hungarian cattle imported from Vienna to England through Holland. Its first appearance is set down on the 27th of June at Islington in a cow purchased on the 19th of June in the London Cattle Market. The facts concerning the *transmission of the disease to Holland* are now well known in all their details. In June a Dutch landowner of Kethel in South Holland sent to his son in England twenty-three fat oxen, to be sold in London. They were several times

offered for sale in the Metropolitan Market, and finally, not finding a sale at an adequate price, re-shipped from London to Rotterdam on the 22nd of July. During all this time the disease was existing in London without being recognized. A few days after their return to Kethel the disease broke out violently in the whole herd. As its real nature was not suspected, no sanitary precautions were taken. It soon spread like wildfire over all the neighbouring communes. A veterinary surgeon was sent specially to examine the nature of the disease. His report, which appeared on the 29th of August in the "Staats Courant," first revealed that it was the contagious cattle typhus. The Government then took some measures to check its diffusion by subjecting the thirteen infected communes to a severe inspection. Too much was still left to the discretion of the local authorities. However, a military cordon of cavalry was drawn round the infected district. All egress of cattle was prohibited, and beyond that zone all cases of the plague were ordered to be destroyed. This measure was successful in retarding but not in arresting the march of the plague. It has several times burst through its bounds and crept into Utrecht, Zeeland, and North Holland. The province of North Brabant, bordering on Belgium, has been hitherto preserved by the more vigorous attitude of the authorities.

8. Meanwhile, with the spread of the disease the trade became more active and the markets more crowded than ever. Sickly and suspected cattle were of course sent there at once in order to avoid a total loss, and thus spread the disease far and wide. *The imports from Holland to Belgium became unusually large*, having attained the figure of 4,609 down to the end of August, the average of the first eight months being in former years only 3,200. These imports, partly derived from the Rotterdam market, the great refuge of suspicious animals, brought the germs of the disease into Belgium. Some infected cattle are known to have entered Belgium on the 16th of August. Many had probably entered before that date. No one here knew then what the disease was.

9. Public rumour announced the *appearance of a mysterious disease, first in England, next in Holland*. Some precautionary measures were immediately applied at the sea-ports, and at the Custom-houses facing the Netherlands. The existence of a contagious disease in England exposed Belgium to no immediate danger, as the imports from

thence are merely nominal, being confined to a few animals generally imported by the Government itself for the improvement of the breed. With Holland the case was different, and the danger from that quarter was imminent. As soon, therefore, as the "Staats Courant" revealed the fatal truth, the Belgian Government hesitated not a single day to close the whole frontier against the importation of cattle. Meanwhile, the plague—swifter in its movements than the Government—had already crossed the border, had broken out on several points of Flanders, and had even penetrated into France.

10. *In Belgium this plague has been stamped out at last by a series of measures which, having been signally successfully, are worthy of being briefly recorded.* In England and Holland such measures are no longer applicable, as the malady has there been allowed to arrive at such a height as to render its extirpation hopeless. The only faint hope left is to circumscribe the disease within a certain zone, and to dispute every mile of ground with it. This is the course now pursued in Holland, but with slight success. The principal centre of infection is still the Schiedam district, where the disease originally broke out, and was allowed to fester without interruption. Down to the 13th of January, 1866, the following are the official results of reported cases from the commencement of the disease :—

	Weekly numbers attacked in three successive weeks.	Total since Commencement.				
		Attacked.	Killed.	Died.	Recovered.	Under Treatment.
Great Britain ..	{ 8,093 9,120 9,243 }	94,256	15,395	55,391	10,008	13,462
South Holland and Utrecht	{ 3,421 3,176 3,020 }	28,737	6,964	8,775	9,486	3,484
Belgium ..	0	306	289	17	0	0

11. The above figures for England and Holland are admittedly inadequate, for the cases officially reported are only a part of those which have actually occurred, many being concealed from interested motives. The character of this disease and its mode of progress cannot be better described than in the following words of the Royal Commission :—

"The cattle plague is, in the language of medicine, a specific disease, belonging to the class of contagious fevers. The contagious matter is subtle, volatile, prolific in an unexampled degree. It is conveyed, in a most virulent form, in the excretions from the diseased animal. It may travel, we know, in the hide, horns, hoofs, and intestines of the dead animal; it lurks undeveloped in the system for a period about which some difference of opinion exists, which certainly is not less than five days, usually seven or eight, but appears to be more prolonged in some cases. Towards the end of this period of incubation, but at what precise period we do not know, it becomes capable of diffusing itself by contagion. A diseased animal may, therefore, be infectious before it shows any signs of disease, or, at all events, before the malady betrays itself to any but a very close and skilful observer. The proportion of cases in which it is fatal is extraordinarily large. No specific has been discovered which neutralizes or expels the poison; judicious treatment may enable nature to resist till the virus has spent itself; injudicious treatment may have a contrary effect; but that is all. The practical conclusion, therefore, at which foreign physicians and foreign Governments have arrived—the conclusion that it is better always to kill a diseased animal or a few diseased animals where by so doing you can kill an isolated germ of disease, instead of suffering that germ to linger and fructify while you are attempting a cure for the precarious prospect of an insignificant saving—is justified by reason; it is also directly justified by experience, which shows that while the plague propagated from a single germ speedily becomes unmanageable, spreads from herd to herd, from province to province, and from country to country, multiplies in a continually increasing ratio, and exhausts itself only after ruinous havoc and a long course of time, it may be effectually eradicated by prompt and unsparing measures."

Section B.—*Sanitary Measures.*

12. *The principles acted upon in Belgium are identical with those so ably expounded above by the highest English authority. The cattle plague is certainly not incurable, as some small proportion of animals recovers even during the most severe epidemics. These cures, however, seem to result from the mildness of the attack, seconded more by the efforts of nature than by those of art. In this*

latter respect we seem to be much in the same position as in 1711, when this malady was first seriously investigated. The curative methods attempted since then have been infinite, and seem to be all equally impotent. The same small proportion of cases seems to recover under all medicinal treatments, and in the absence of any.

The Belgian Government has come to the conclusion, which is also that of the French Government and of the Royal Commission of England, that the only effectual treatment is to prevent the pestilence from effecting a lodgment by destroying it in the germ whenever it appears.

13. The Articles 459, 460, 461, and 462 of the Penal Code contain some provisions for the detection and repression of contagious diseases among cattle, and further expressly maintain the former laws and regulations on the subject. These laws and regulations form a special branch of legislation, embodied, firstly, in a long list of edicts and ordinances issued in the several States of the Austrian Netherlands from the early till the latter part of last century, which, being mostly local, temporary, and incompatible with present institutions, have become obsolete; secondly, in the Ministerial Circular of 23 Messidor, An V, (1797), which recapitulated, strengthened, and confirmed the principal dispositions of the ancient legislation of France. This circular was, together with the Arrêt du Conseil of 1784, duly inserted in the Bulletin des Lois, was promulgated in these Belgian Departments of the Republic by a Consular Arrêté of 1803, and is therefore still in force. Some further dispositions on the subject are to be found in the laws of 1790, 1791, and 1816, the latter creating the "Fonds d'Agriculture." These laws, if analyzed, will be found to impose the following obligations :—

14. *A. On Private Individuals.*—(1.) Stock-owners, herds, and veterinary surgeons, are to notify immediately to the Bourgmestre the existence of any diseased or suspicious cattle.

(2.) To submit to the destruction of animals declared incurable.

(3.) To bury the carcasses with every precaution.

(4.) To destroy all contagious objects, and to disinfect the cow-sheds.

(5.) The sheds not to be used again until permission is granted.

(6.) The cattle of an infected district to be counted and described.

(7.) No cattle to be moved out of it so long as a murrain exists therein.

(8.) Cattle destined for the butcher (in the infected district) to be slaughtered on the spot with every precaution.

15. *B. Duties of local authorities :—*

(1.) To inform the provincial authority of the outbreak of any murrain on the same day.

2. To notify the same by placards or otherwise to the inhabitants of the commune, to count and brand the cattle with the letter M.

(3.) To visit all cow-sheds periodically, so as to make sure that no animal has been removed.

(4.) To refuse certificates of health to any cattle desired to be removed.

(5.) Animals belonging to an infected district, if found outside of the same, must be taken to the "juge de paix" and killed in his presence.

(6.) To order the destruction of incurable animals upon the declaration of the Veterinary Surgeon.

(7.) To execute all the necessary formalities for the settlement of compensation.

16. *C. Duties of the provincial authorities :—*

(1.) To prescribe to the local authorities the measures which may be necessary.

(2.) To send delegates to the spot in order to ensure the executive of all these measures. To the above dispositions is to be added the power of suppressing fairs and markets, which the Government derived from the Provincial Law of 1836.

17. The above powers were found insufficient for an emergency like that of August last. The most essential measures of all were not expressly authorized by any law, as, for instance, the closing of the frontier, the destruction of sick and suspected animals, and the prohibition of common pastures. These two latter measures may be indirectly sanctioned by a wide interpretation of the Laws of 1790 and 1791, but no law could be construed to invest the Government with the power of prohibiting imposts. In the face of an imminent danger, it did not hesitate one moment to assume this serious responsibility, and to cut off a great trade in a necessary of life, amounting in one year (1868) to a quantity of 68,000 head of cattle, and to

a value of 672,680*l.* The Royal Arrêté of the 30th August excludes all imports of cattle by land or sea. This Arrêté was completed by others of the 7th of September, 11th October, 19th December, and 20th January, closing the seaports and Dutch frontier against the imports of hides or other parts of horned cattle, against sheep, against dung, straw, hay, and stable utensils, and against all ruminant animals whatever. This latter measure was occasioned by the late importation of the plague from the Zoological garden of London to that of Paris by a gazelle.

18. As the plague had already penetrated into Belgium, the great object was to stifle it in the germ. For this purpose a *circular of the 28th of August* to the Governors of provinces ordered the immediate destruction of the diseased animals, as well as of all objects contaminated by them, the disinfection of the sheds, and the isolation of suspected animals. The Minister thus further stimulates the zeal of his subordinates:—

“ Dans une calamité semblable il ne faut pas seulement que chacun fasse son devoir, il faut qu'on l'accomplisse avec passion, et qu'on ne laisse échapper aucune occasion de prévenir le mal ou de l'extirper. C'est surtout le zèle des autorités locales et des médecins vétérinaires qu'il importe de stimuler, en leur rappelant la grave responsabilité qui pèse sur eux. Leur vigilance et leur activité doivent être telles qu'aucune circonstance qui de loin ou de près se rattache au fléau dont nous sommes menacés ne doit leur rester inconnue, et qu'aussitôt l'information reçue, ils agissent immédiatement dans la limite de leur droit et selon leur devoir.

“ En transmettant ces instructions aux autorités locales et aux médecins vétérinaires, vous les informerez en même temps que provisoirement ils jouissent de la latitude la plus grande, les vétérinaires pour provoquer l'abatage des animaux atteints et la séquestration des bêtes suspectes, les administrations communales pour ordonner l'abatage et tous les moyens de police requis pour empêcher la contagion.”

This circular was accompanied by a short popular pamphlet entitled “ Notice sur la Peste Bovine,” to be distributed through every commune in the kingdom.

19. Further Royal and Ministerial Arrêtés of the 3rd of September authorized Governors of provinces to order the slaughter of animals called “ suspected,” on account of

their having been in contact with diseased animals, and allowing for both kinds a compensation limited to two-thirds of their value while in health. The owners of suspected animals are also allowed, under certain precautions, to dispose of the meat. The previous amount of compensation allowed by the Arrêté of 1854 was only one-third of the value. The value is determined first by the veterinary surgeon and then by two "experts," named and sworn by the bourgmestre. The average of these two valuations is taken as the basis for compensation, and may be revised, on appeal being made by the Governor, by a Commission of Inquiry to be appointed by the Administration.

20. These Arrêtés were communicated and explained to the Governors by a *circular of the 4th of September*, laying down rules for the slaughter of the animals, for the burial of the hides and offal, and for the carriage of the meat. The bodies of all diseased animals are to be buried entire, as far as possible from the buildings, in pits at least 2 mètres deep, and to be sprinkled with quick lime, the hides being first slashed to make them unsaleable. The bodies are not to be dragged on the ground, but to be carted. The legality of these measures is deduced, though not explicitly, from the Arrêt du Conseil of 1784 and from the Rural Code of 1791. The indemnities are paid by the Minister of the Interior under the chapter of his budget called "*Fonds d'agriculture*." This was originally a Government insurance fund created in 1816 by a tax on the owners of cattle. On the separation of the two kingdoms 1,000,000 florins were paid to Belgium by the Netherlands as her share of this fund. The principle of insurance was abandoned, but this Government assumed the responsibility of paying out of this fund a compensation for all cattle slaughtered by authority. When a commune is declared infected, the owners of cattle may not sell or kill them without a written permission from the bourgmestre and a certificate from the veterinary surgeon. The butchers may not sell any animal alive which they have bought, but must kill and cut it up within twenty-four hours. In such communes dogs are to be kept tied up, and those wandering about must be killed. The bourgmestres of neighbouring communes must order a census of the cattle, and not allow the introduction of a single beast until it shall have passed a veterinary inspection. Even when declared healthy it must remain isolated for at least ten days. Another circular of the 17th September ordered

certain extraordinary precautions for cattle fairs, markets, and pastures common to several communes.

21. It was supposed that all these measures, stringently executed as they were, would have sufficed to extinguish the several centres of infection which had broken out. Such was, however, not the case. As fast as the original centres were put down, new ones formed themselves at the most distant points of the country, all traceable to animals purchased at the markets, although the latter were severely inspected. Therefore a *Royal Arrêté of the 22nd September suppressed all fairs and markets* destined for the sale of horned cattle other than those meant for immediate consumption. Even these animals were to be provided with certificates declaring that the commune from which they came was free from the typhus, and had been so for at least twenty days. Fines of 500 francs are imposed for breaches of this rule, and of 1,000 francs on bourgmestres who deliver false certificates. This rule is still enforced throughout the kingdom, though no doubt with some laxity. One great object of closing the markets, especially that of Malines, was to shut a door against smuggling by leaving no safe refuge for smuggled animals.

22. All these measures depended for their execution on the concurrence of active and zealous agents. These were furnished by the *Veterinary Corps*. There is one or more of these called "Vétérinaire du Gouvernement" in every agricultural district, and generally in every canton.* They receive no regular salary, but are paid in the shape of travelling allowances whenever their services are required. Their official duties consist in watching and reporting every case of contagious disease. Some errors were committed by them in the beginning, by mistaking the plague for other diseases or other diseases for the plague. They could not be expected to know a disease which they had never seen. One of the first cares of the Government was to make them acquainted with the nature of the malady. For this purpose several were selected in the provinces most exposed to danger to go and study the disease in Holland. On their return they were placed at the disposal of the provincial authorities in order to serve as guides to the latter and to their own colleagues. They were also

* There are 223 "Sections Vétérinaires," each occupied by one practitioner. Their duties are to visit fairs, markets, and farms. They are allowed a certain sum, 2 francs per league, for their travelling expenses. In Luxembourg alone they enjoy, in addition, a fixed stipend.

called upon to impart their knowledge in lectures to be given at the seats of infection over the dead bodies, with a view to communicate a certain diagnosis of the malady. This measure has produced the best results. A Royal Arrêté of the 7th of November sanctioned the employment of additional veterinary surgeons, and the adoption of a new scale of fees to be paid them for their services.

Section C.—Results.

STATEMENT of the Number of Cattle which have died of or been killed for the Cattle Plague in Belgium, since its commencement in August down to the end of 1865.

Provinces.	Number of Communes infected.	Number of Cattle killed.			Total Killed by Hand.
		By Disease.	By Hand.		
			Diseased.	Suspected.	
Antwerp	2	1	3	..	3

„ East	12	1	131	64	195
Hainaut	8	6	19	6	25
Limbourg	1	..	2	3	5
Total	46	17	289	149*	438

23. It appears that down to the end of 1865, the plague had shown itself in 46 communes of 6 provinces; that it had attacked 306 animals, of which 17 died of it and 289 were slaughtered; that in addition, 149 suspected beasts were killed, making a total loss of 455 for the whole kingdom. Among the 46 communes there are 30 where the plague appeared only once, and 16 where it broke out a second and even a third time. The localities where at first it was mistaken or concealed are those which had to struggle the longest to dislodge it. On one farm at Leffinghen the whole herd of 40 were killed between November 23 and December 8. Three weeks after, on December 30, the same disease broke out among the sheep; and the whole flock of 112 were sacrificed, 11 as diseased, and 101 as suspected. The carcasses of the latter being perfectly sound, were sent for sale to England. *The plague is now extinct throughout the whole kingdom excepting in the town of Antwerp.*

* Suspected animals which, on dissection, showed the internal symptoms characteristic of the typhus are here classed among the diseased; but as not all were dissected the figure of the "suspected" is still overcharged. On the other hand, the true nature of the disease in many of the isolated cases reported as typhus may be doubtful.

24. This immunity cannot be expected to last long. The last accounts from Holland show that the plague is breaking through every barrier raised against it, and must overrun the whole kingdom. The Dutch population are impatient of all restrictions. In the Province of Utrecht the action of the authorities is resisted by force, and has to be supported by military detachments. There are cases in which the troops are beaten off by large bands of peasants, and have to take the cow-houses by regular siege. Should the plague take root in North Brabant and Zeeland, nothing can save the neighbouring Belgian Provinces from *partial outbreaks*. One has lately occurred in a milkman's premises in the city of *Antwerp*, traceable to a smuggled cow; the egress of cattle from the town was prohibited, and the market was closed. The orders of the authorities have not been resisted in Belgium, but have to be executed with the support of the gendarmerie, for the Flemish population share the indocility of their Dutch neighbours.

25. *The plague entered Belgium under the most dangerous auspices*, and at many different points. It was left to itself for about a fortnight, and had time to form several centres of infection. Considering the term of incubation, which in the present epidemic seems to be unusually long, the cases observed here may be divided into two series; first, those which broke out within twenty days after the frontier was closed, and which may be attributed to immediate contagion from the Dutch imports; secondly, those which appeared after that term, and may be attributed to secondary infection. Twenty-eight communes were infected in the first way, and eighteen in the second.

26. The losses hitherto inflicted by the present epidemic are insignificant. Those of the farmers have been repaid to a great extent by the Treasury. Only ten stock-owners have lost more than ten head each. The highest losses on any single farms were thirty-seven and forty at Alost and Leffinghen. *The entire claims for compensation* have been finally liquidated at 94,182 francs. To that sum has to be added the cost of the veterinary service. The effect of the restrictions on markets has not been felt by consumers. Those for fat cattle continue to be well supplied. Some attempts were made to raise prices in the beginning, but were defeated by increased supplies coming forward. Ninety-four thousand francs is a merely nominal sacrifice when the magnitude of the danger and of the interests at stake is considered. The number of horned

cattle at the last census of 1856 was found to be 1,250,000, but must be greater now.

27. It is easy to prove that the *amount of compensation allowed* is more than sufficient. As the chances of recovery are hardly 15 per cent., an animal once attacked by the typhus is really not worth one-sixth, still less two-thirds of its previous value when in health. With regard to "suspected" animals, it might, at first sight, be alleged that they are worth as much as ever. The slightest consideration will show, however, that here again a considerable bonus, and certainly no injury, is offered to their owner. It is only cattle which have lived with diseased animals that are treated as suspected. Experience shows that few such escape infection, and few of the infected escape death. It is evident, therefore, that a suspected animal, if its antecedents were made known, would not fetch half its normal price. If then, to the two-thirds paid by the Government, be added the value of the meat, when this is allowed to be sold, it is evident that the farmer must be a gainer rather than a loser by this arrangement. Many of the suspected animals are found on dissection to show some of the pathological lesions peculiar to the cattle typhus, and therefore may fairly be treated as having the disease already in germ, though externally healthy.

28. The average prices hitherto realized for the meat of suspected animals have been from 70 to 90 centimes per kilogramme. In the first stage of the disease the meat shows no sign of deterioration, but cannot be sold. In Holland the meat of diseased animals is openly sold by the butchers, though in this stage it becomes discoloured and repulsive to the eye. There the temptation is too great thus to recover some part of the heavy losses sustained. Here this is impossible, for every animal condemned as diseased must be buried, from dread more of the contagiousness than of the unwholesomeness of this meat. *The average compensation hitherto paid in Belgium* amounts to 222 francs (8l. 17s. 6d.) per animal, a sum certainly superior to two-thirds of the average value of Belgian cattle. The compensation awarded for the sheep at Leffinghen was 70 francs per head, also much above even the whole of their real value. This shows that the valuations are always assessed on a scale more favourable to the interests of individuals than to those of the public. The Government has a right of revision.

29. *The technical legality of the measures adopted* has

been contested, and with some foundation. The 11th Article of the Constitution declares that no one shall be deprived of his property unless in the *forms established by law and for a just and previous indemnity*. The text of law allows the destruction of animals declared "incurable," but not of all attacked by or suspected of being attacked by a disease. It was only by a very wide interpretation of some ancient laws that the above power could be held to extend to such cases. No law could be construed to authorize the prohibition of imports and transit. The Minister of the Interior had the courage to take this great responsibility, and thus alone saved this country from incalculable losses. The measures taken must have pressed severely on many private interests; but so far from showing any impatience, the country seems to be thankful to the Government for its preservation from the scourge. The course pursued has been sanctioned by public opinion and by the representatives of the nation, as evinced by the proceedings in the Senate on the 23rd of December, and by those in the Chamber on the 19th of January.

30. The power to seize and slaughter is no doubt useful when the plague is isolated and incipient. When, however, a whole country is saturated with the poison, such a course can but increase the waste of property. At the first appearance of the plague in England, Messrs. Gamgee, Simonds, and other qualified practitioners, laboured strenuously, though against their own interests, to inculcate the above course of action. Their warnings were unfortunately derided. Since then the teaching of events has become irresistible, and has produced a natural reaction in public opinion. *It is now too late to "stamp out" but may yet be possible to starve out the disease.* The Royal Commission have recommended the way to effect this, viz., the temporary suspension of cattle traffic, which will probably yet be enforced. It seems to be generally felt that the present wholesale destruction of property and diffusion of poison entitle the sufferers to every protection that Civil Government can afford. The words of the Royal Commission are: "Against a disease which is highly contagious, undiscoverable at a certain stage, and too widely diffused for an army of inspectors to cope with it, there is clearly but one remedy which would be certainly and absolutely effectual: That remedy is to prohibit everywhere for a limited time any movement of cattle from one place to another. Enforce this, and within a

time which cannot last very long the disease is at end. It must stand still, and it must starve for want of nutriment. This great sacrifice would certainly eradicate the evil. We cannot say so of any sacrifice less than this."

31. Belgium is evidently the next country marked out for attack—the plague is knocking at her door, and is ready to creep in at every loop-hole left unguarded. *The last accounts from the Netherlands* are deplorable, and leave no hope of saving any part of the territory. The pestilence is gaining ground, and seems likely to become rooted there for years. Land has of course lost half its value, whether for selling or letting, most of it being rich pasture crowded with cattle. The long land frontier between the two countries cannot be hermetically closed. Belgium must therefore expect some further partial outbreaks, and will require much vigilance to prevent any of these from effecting a permanent lodgment.

32. Thus the plague has just broken out in the city of Antwerp. One cow belonging to a dairyman was destroyed as being attacked by the disease, the other five in the same shed were killed as "suspected." On being opened three of them showed incipient symptoms of the disease, and were buried; two were declared sound, and their meat allowed to be sold. The town was of course declared infected, and the other legal measures were taken by the bourgmestre. All cattle were ordered to be counted, their egress was prohibited, and the market was closed. Another outbreak occurred immediately after in the same street, Rue de la Cuiller.

Section D.—*Mr. Seutin's System.*

33. *Mr. Seutin*, a highly respectable chemist of Brussels, brother to the late eminent surgeon, has turned his attention to the cattle plague from its first appearance. After numerous experiments on himself and on animals, he has *elaborated a system*, founded on the homœopathic principle, and calculated both *for prevention and cure*. With *Mr. Gaudy*, an ex-professor of the Veterinary College, he offered to treat cattle in Holland gratuitously under certain protection from the Government. Their offer was accepted, and the environs of Schiedam, the principal focus of infection, were assigned to them for their experiments.

34. They complain of having had to contend against very adverse circumstances, such as especially the malevo-

lence of the Dutch veterinary corps, the carelessness of the farmers, and the absence of assistance. Thus it often occurred that they were wilfully sent for too late when the malady was too far advanced. Nevertheless, they cured from 70 to 80 per cent. of the cases which they treated. In one commune only, that of Mathenesse, *the results of their practice* were officially certified. A translation of the certificate is given below. The number of forty-six cures among sixty-three cases there recorded is equivalent to a proportion of 73 per cent. Both these gentlemen have expressed to me their certainty that that proportion would have been much higher but for the jealousy and difficulties which they encountered. The results in other cases not certified were still more successful.

Certificate of the Bourgmestre of Mathenesse.

(Translation.)

"Statement of the cattle treated by Messrs. Seutin and Gaudy in the commune of Old and New Mathenesse, between the 22nd of September and the 3rd of October, 1865, on the premises of eighteen cattle-owners, whose cattle had been declared by the Netherlands Veterinary Surgeons to be attacked by the reigning distemper, the cattle typhus.

"(Here follow eighteen names of farmers.)

	Animals.

Total	63	46	17

"Certified by me, Bourgmestre of the Commune of Old and New Mathenesse, the 17th of November, 1865.

(Signed) "P. J. VAN DYK VAN MATHENESSE."

35. *The results of their preventive system* were also very encouraging, though not equally decisive. Among 125 beasts on which it was tried in a highly infected district, only four took the disease during the first fifteen days. Later on, it is true that others fell victims, but this Mr. Seutin ascribes to the neglect of the farmers in his absence. The system is troublesome, especially with cows at grass.

36. *No official report* that I am aware of has yet been made public regarding Mr. Seutin's practice in Holland. The Veterinary Corps in Holland may very possibly be

prejudiced against homœopathists and strangers. The Government has been probably obliged to defer to the counsel of its responsible professional advisers in not further calling in Messrs. Seutin and Gaudy. Still it has shown its appreciation of their services, by doubling the amount of remuneration which they claimed, making it up to 1,000 florins, or 83*l.*, for all their expenses during nearly a month's stay at Schiedam. They had previously been placed on the footing of first class "Vétérinaires du Gouvernement" for pecuniary allowances. I have reason to know that the Governor of South Holland formed a very favourable opinion of their practice.

37. *Messrs. Seutin and Gaudy are now ready, if required, to proceed to England* for the purpose of treating the cattle plague, and are certainly very confident of success. They describe their objects to be more scientific and benevolent than pecuniary. This is probably true of Mr. Seutin. They require, however, to be secured against loss, and to receive certain guarantees. I have advised them to go and practice their art freely in England, and to derive their remuneration from the parties immediately benefited. Mr. Seutin was ready to adopt this course, and even to act on the principle: "No cure, no pay." But Mr. Gaudy declines to encounter any risk, and his co-operation is deemed indispensable. The conditions which they demand may be reduced now to the following two:—1. To receive a sum of 200*l.*, which is to cover all claims for travelling to London and back, for living in England, for medicines, and for their own remuneration. 2. Their travelling expenses from place to place in England, the wages of two skilled interpreters, the necessary assistance and appliances for the proper treatment of cattle are also to be secured to them. In return they undertake to place themselves at the disposal of any authority which engages them for three weeks, to treat the greatest possible number of sick cattle during that time without making any charge, and to impart their system freely to all.

38. These proposals may be worth the attention of Her Majesty's Royal Commission or of other bodies, such as cattle insurance companies, &c., interested in the matter. It will be alleged that homœopathy has signally failed in dealing with this malady. This may be true of the experiments hitherto tried, but argues only the inefficacy of a particular treatment, not that of a whole system of medicine. There is no proof that the system applied in

Norfolk was similar to that of Mr. Seutin. *The homœopathic is still more multifarious than the allopathic pharmacopœia.* The true specific drug for combating every morbid symptom is only to be elicited by a series of practical experiments. This Mr. Seutin believes that he has at last successfully accomplished for the numerous symptoms constituting the cattle typhus. His practice is not rigidly homœopathic, excepting in its main principle, that of applying drugs which produce in a healthy body the same symptoms which are desired to be cured "*similia similibus.*" One great advantage of this system is that it leaves the constitution totally uninjured, which cannot be said of the drastic remedies, such as creosote, &c., of the allopathic school. An animal once cured of course acquires additional value, as being thenceforth proof against the plague.

39. *Viscount Sidmouth*, who is now resident here, in the "Times" of the 15th instant *calls attention to, and strongly advocates this proposed experiment*, saying, "It is for the agriculturists themselves, therefore, to decide whether they will undergo whatever risk there may be in calling in, during the present terrible emergency, those whom I am entitled to call the only practitioners hitherto successful. They will be ready to leave Brussels within a week from the day the summons reaches them, and will be prepared to commence work almost immediately after their arrival. I wish to add that, after careful examination of Messrs. Seutin and Gaudy's terms, and consideration of many circumstances upon which I cannot here enter, I have satisfied myself that what they ask is fair and reasonable. It is perhaps hardly necessary to say that I do not recommend the services of these gentlemen to my countrymen as the supporter of any particular system, but solely on account of the good which I firmly believe they are capable of effecting, nor that before doing so I have become convinced of their high respectability."

40. It must be acknowledged that *this new process has undergone an actual practical test.* It is true that the disease has assumed a mitigated form in Holland as compared with England. The proportionate number of recoveries is certainly much greater as indicated by the Table No. 1. The experiments hitherto made were on a comparatively small scale. Their results are certainly such to encourage a further trial, without perhaps warranting an unqualified certainty of success under all possible circumstances.

Lord Sidmouth offers while here to be the medium of any *bond fide* communication with Messrs. Seutin and Gaudy. For my own part I readily make the same offer.

(Signed) H. P. T. BARRON.

41. P.S. *January 23, 1866.*—I have just been informed that a Bill is about to be brought in, giving the Government full powers, firstly to prescribe any measures which the danger or the actual presence of contagious cattle diseases may render necessary, whether in the interior or on the frontier of the country. Secondly, to determine the conditions and rates of compensation to be paid for animals slaughtered by authority. Thirdly, to proceed at law against offenders of the rules thus prescribed. Infractions of these regulations to be visited with imprisonment from three months to two years, and with a fine of from 100 to 1,000 francs. Fourthly, in case of extenuating circumstances, the penalties of fines and imprisonment may be reduced to those termed "of police." It is highly probable that a military cordon will be posted on the frontier facing the Netherlands, to prevent the smuggling of cattle.

Report by Mr. Middleton	December 20, 1865	504

Spain.

Report by Mr. West, Her Majesty's Secretary of Legation.

Madrid, July 1, 1866.

THE state of the live stock in Spain has always been a matter of great importance to the country, and has been the subject, at different periods of its history, of many complicated legislative enactments and Royal Ordinances. I have endeavoured, in another place, to explain the peculiar privileges which were obtained by the holders and breeders of stock in former times, and the curious institution of "La Mesta,"—privileges and immunities arising from the Crown by the influence which the members of this Body exercised.

The abolition of these privileges, which had had the effect of preventing, in a great measure, the cultivation of the land, has been in this respect attended with beneficial results; and although live stock has not actually declined in consequence, it cannot be said to have increased, when its importance to the necessities of the population is considered.

According to some statistics, published in the year 1756, it would seem that the number of live stock then existing in Spain was 29,006,238, not including horses and mules of luxury. There were, besides, 2,933,277 head belonging to ecclesiastical establishments. This computation, however, did not include the Provinces of Aragon, Catalonia, and the Basque, so that the total number may fairly be set at 40,000,000. Now the computation for 1858 gives 20,104,085, and that for 1859, 26,014,338. The latest one, however, gives the the following Returns:—

Horses	..	672,559	Goats	..	4,429,576
Mules	..	1,001,878	Pigs	..	4,264,817
Asses	..	1,290,814	Camels	..	3,104
Cattle	..	2,904,598			
Sheep	..	22,054,968			
					36,622,314
					2 M

Although a diminution of 3,377,686 head cannot be considered very much, it assumes greater proportions when regard is had to the difference in the amount of population, which in 1756 was only 7,473,187, while it is now 15,673,536. Thus with a population which has more than doubled, the number of live stock cannot be said to have increased or diminished.

Its proportion to every 100 inhabitants is as follows :—

Horses..	..	4·20	Sheep..	..	140·54
Mules	6·40	Goats..	..	28·28
Asses	8·12	Pigs	26·24
Cattle	18·56	Other beasts	..	214·92

The small proportion of horses appears remarkable, and evidently shows that the mule and ass are preferred for all agricultural and draught purposes. For domestic and carriage use, foreign countries supply large numbers. Considerable numbers of native horses are still required, and in 1863 the Cavalry and Artillery took 12,154. This latter branch of the service, however, employs mules to a great extent.

As regards other countries, Spain ranks fifth in the total number of horses, mules, and asses, and fourth in their proportion to every 100 inhabitants, as the following statistics will show :—

Country.			Population.	No. of Head.	Proportion.
Saxony	2,225,240	884,472	39·75
Italy	21,776,953	5,875,000	26·98
Russia	68,931,728	13,660,000	19·82
Spain	15,673,536	2,965,251	18·92
Hanover	1,888,070	259,300	13·73
Denmark	2,734,914	375,000	13·71
Turkey	15,500,000	1,950,000	12·58
Greece	1,067,216	120,000	11·24
Sweden	5,167,978	511,000	9·89
France	36,755,871	3,607,000	9·81
Prussia	17,739,913	1,570,000	8·85
England	29,031,164	2,500,000	8·61
Portugal	3,923,410	317,000	8·08
Austria	37,754,856	2,856,460	7·57
Bavaria	4,689,837	349,690	7·46
Switzerland	2,513,494	145,500	5·80
Holland	3,569,456	206,000	5·77
Baden	1,239,291	73,900	5·52
Belgium	4,782,256	250,000	5·23

As regards the total number of horses, mules, and asses, therefore, Spain is not much behind other countries. This cannot be said with respect to cattle, for it will be seen from the following Table that she holds the eighth place as regards numbers, and the last but one as regards the proportion to the population :—

Country.	No. of Head.	Proportion.
Greece	900,000	84·33
Bavaria	2,625,300	55·95
Turkey	15,000,000	51·67
Sweden	2,499,000	48·35
Hanover	794,000	42·06
Switzerland ..	950,000	37·85
Denmark	1,018,000	27·23
Baden	481,000	35·99
Russia	22,120,000	32·10
Austria	11,389,000	30·14
Italy	6,500,000	29·84
Prussia	5,042,000	28·42
Holland	1,000,000	28·01
France	9,936,000	27·03
Saxony	544,910	24·49
Belgium	900,000	18·82
Spain	2,904,598	18·56
Portugal	596,059	15·68

It would seem, however, that the quantity of the larger live stock—that is, horses, mules, asses, and cattle, which, taken together, number 5,869,849—is sufficient for the amount of land under cultivation according to the calculation here, that only 2 beasts of burden are sufficient for the proper annual culture of 100 fanegas of land, or 84 acres. The area of land which is actually not barren, and is fit for some species of cultivation, contains 41,217,138 fanegas, or 35,328,972 acres, so that the proportion would be 14·24 head to the 84 acres. As regards sheep, Spain ranks next to England and Greece, both in numbers and proportion to inhabitants, as will be seen from the following Table :—

Country.	No. of Head.	Proportion.
Greece	2,500,000	235·19
England	50,000,000	172·23
Spain	22,054,000	140·84
France	34,000,000	92·50
Turkey	14,300,000	92·26
Prussia	16,236,000	91·54
Hanover	1,631,000	86·38
Austria	30,000,000	79·46
Portugal	2,383,041	60·74
Russia	39,000,000	56·58
Sweden	2,680,000	51·86
Denmark	1,200,000	43·88
Bavaria	1,899,900	40·51
Italy	6,500,000	29·85
Saxony	583,000	26·21
Switzerland	550,000	22·31
Belgium	830,000	17·44
Holland	560,000	15·69
Baden	189,000	14·11

In the number of goats Spain is first.

Country.	No. of Head.	Proportion.
Spain	4,429,576	28·28
Portugal	1,066,241	27·18
Switzerland	350,000	13·94
Turkey	1,500,000	9·68
Italy	1,750,000	8·04
Sweden	363,000	7·02
Denmark	105,000	3·84
Saxony	64,975	2·92
Greece	300,000	2·81
France	964,000	2·62
Holland	90,000	2·52
Bavaria	107,240	2·29
Russia	1,150,000	2·25
Prussia	395,000	2·23
Belgium	85,000	1·78
Baden	22,100	1·65
England	210,000	0·72
Austria	238,000	0·63
Hanover	8,000	0·42

The abundance of this animal can scarcely be considered as showing the prosperity of the live stock, especially when it is seen that as regards the more important and useful races of animals Spain is far behind other countries. It is a singular fact that the least useful, perhaps, of domestic animals for agricultural purposes should be that which is the most numerous in proportion to the inhabitants, and in numbers, as compared with other countries.

Where cattle and pigs abound, for they appear generally in a certain proportion, it seems that goats are scarce, but this certainly is not the case in Spain, as the number of pigs does not exceed the number of goats.

I find the following statistics relative to the swine in Europe :—

Country.	No. of Head.	Proportion.
England	18,000,000	62·01
Spain	4,260,817	27·24
Portugal	895,520	22·81
Baden	300,000	22·40
Austria	7,000,000	18·54
Bavaria	842,850	17·97
Sweden	892,000	17·20
Holland	500,000	14·01
France	4,900,000	13·33
Prussia	2,116,000	11·93
Italy	2,550,000	11·71
Switzerland	280,000	11·15
Hanover	201,000	10·64
Russia	6,300,000	9·01
Belgium	400,000	8·36
Denmark	150,000	5·48
Saxony	120,931	5·43
Greece	40,000	3·75
Turkey	300,000	1·94

The small live stock appears more numerous in this country than the large.

The next Table shows the proportion per head of live stock used for food in the different countries of Europe :—

Countries.	Proportion per Head.	Countries.	Proportion per Head.
Greece	3·20	Bavaria	1·17
England	2·87	Russia	1·00
Spain	2·15	Denmark	0·90
Turkey	1·57	Switzerland	0·85
Hanover	1·40	Baden	0·74
France	1·35	Italy	0·69
Prussia	1·34	Holland	0·60
Austria	1·28	Saxony	0·59
Portugal	1·26	Belgium	0·46
Sweden	1·24		

As regards Spain it will be seen that she is next to England in alimentary means. I cannot, however, vouch for the complete accuracy of these calculations as computations of cattle must necessarily be subject to errors, but I believe they are substantially correct.

It now only remains to show the proportion of live stock to the land in Spain and in other countries.

Nations.	Land fit for Stock and under Cultivation.	No. of Head of Live Stock.	No. of Head per Kilomètre.
	Sq. Kilomètres.		
England	313,128	85,710,000	273·72
Saxony	14,988	2,198,428	146·68
France	542,397	53,407,000	98·47
Prussia	280,194	25,359,000	90·50
Belgium	29,456	2,465,000	83·68
Austria	644,850	51,483,845	78·29
Bavaria	75,981	5,824,980	76·66
Hanover	38,456	2,893,300	75·24
Greece	52,259	3,860,000	73·86
Holland	32,589	2,356,000	72·29
Spain	507,036	36,622,313	72·23
Baden	15,284	1,066,000	72·23
Italy	350,889	23,175,000	66·05
Switzerland ..	40,731	2,245,500	55·13
Portugal	100,031	5,257,861	52·56
Denmark	56,843	2,848,000	50·10
Russia	5,450,199	82,230,000	15·09
Turkey	2,085,596	26,250,000	12·59
Sweden	757,852	6,945,000	9·16

It follows from these statistics, therefore, that Spain, as regards other countries, holds the fifth place in the number of live stock of all kinds, and the tenth in its proportion to the land. Considering the scanty population, the depressed state of the agricultural interest, the little attention which is paid to improving the breeds of the animals most useful, and the want of capital, the actual quantity of live stock must be taken as an indication of what it might become under more propitious circumstances.

The importation of foreign stock of all kinds is considerable.

I have drawn up the following Table from the official Returns for the years 1858, 1859, 1860, 1861, 1862, and 1863 of the imports.

	1858.	1859.	1860.	1861.	1862.	1863.
Horses ..	2,065	1,599	1,660	1,911	2,115	2,256
Asses ..	550	379	366	483	561	740
Goats ..	438	1,660	933	1,576	961	993
Pigs ..	3,720	2,066	2,907	2,527	1,821	2,888
Sheep ..	9,163	21,487	10,259	18,836	7,644	27,386
Mules ..	10,935	11,203	10,989	14,210	14,372	12,790
Cattle ..	5,402	5,402	3,957	9,203	6,592	7,921

Most of the sheep are imported from Portugal and Algiers, and most of the horses and mules from France.

The importations from England are very small.

The exportation of live stock during the same years was as follows :—

	1858.	1859.	1860.	1861.	1862.	1863.
Horses ..	237	259	68	145	190	229
Asses ..	88	77	217	151	48	57
Goats ..	316	301	699	304	400	429
Pigs ..	3,069	3,217	5,414	8,553	10,860	10,339
Sheep ..	14,998	5,987	17,364	38,907	11,858	7,098
Mules ..	357	73	125	153	48	77
Cattle ..	8,858	8,048	15,302	19,565	17,459	17,136

Of the number of pigs exported in 1863 there were 878 to France, 8,627 to Gibraltar, and 816 to Portugal; sheep, 684 to France, 5,914 to Gibraltar, and 500 to Portugal; none to other countries. Cattle, 6,147 to England, 556 to France, 2,056 to Gibraltar, and 8,377 to Portugal.

In 1862, 175 horses were exported to Portugal, 7,394 pigs to Gibraltar, and 2,029 to Portugal. 1,243 sheep to France, and 10,535 to Gibraltar. 7,878 head of cattle were shipped to England, 2,581 to Gibraltar, and 6,061 to Portugal.

In the year 1861 very few horses were exported. Of the 8,553 pigs, 4,056 went to Gibraltar, and 2,512 to Portugal; 36,838 sheep, and 3,261 cattle went to Gibraltar, and 6,972 head of cattle were exported to Portugal.

During the year 1860 the export of live stock was much less.

Scarcely any horses, and only 5,414 pigs, 3,209 of which went to Gibraltar; of the 17,364 sheep and 15,302 cattle, 15,300 sheep and 5,700 cattle went to Gibraltar, and 3,825 to Portugal.

In the year 1859, 225 horses were exported to Portugal. Of the 3,217 pigs, 2,346 went to Gibraltar; of the 5,987 sheep, 5,430 to Gibraltar, and of the cattle 1,500 to England, 464 to France, 2,366 to Portugal, and 3,596 to Gibraltar.

Coming to the year 1858 a still further diminution will be remarked in the exportation of pigs and cattle. Of the 3,069 pigs exported, 2,103 went to Gibraltar, and of the 14,433 sheep, 14,433 went also there, besides 3,066 head of cattle.

The variation in the export of sheep appears considerable.

I am unable to state the ultimate destination of the proportionately large quantity of live stock exported from this country to Gibraltar, for it cannot be for the consumption of that fortress alone.

The following is the declared value of the live stock exported from Spain during the six years 1858 to 1863 inclusive.

	1858.	1859.*	1860.	1861.	1862.	1863.
	£	£	£	£	£	£
Horses ..	1,617	..	1,320	2,320	3,800	4,580
Asses ..	1,442	..	5,155	1,405	1,185	1,500
Goats ..	189	..	419	182	820	843
Pigs ..	8,710	..	21,656	25,659	38,010	32,861
Sheep ..	13,492	..	12,626	25,678	10,079	5,394
Mules ..	9,265	..	1,432	2,448	720	1,386
Cattle ..	61,375	..	137,718	136,955	122,213	119,952
	96,090	87,927	180,320	194,647	176,327	166,016

There is no duty on the export of live stock.

The following is the declared value of the live stock imported into Spain during the same period :—

	1858.	1859.	1860.	1861.	1862.	1863.
	£	£	£	£	£	£
Horses ..	77,660	59,804	59,902	71,500	73,604	83,510
Asses ..	880	606	585	772	897	1,258
Goats ..	114	365	279	404	345	337
Pigs ..	3,999	3,879	3,091	1,801	1,294	3,322
Sheep ..	2,608	6,060	2,539	5,161	2,209	9,012
Mules ..	41,178	115,492	118,522	158,966	161,154	127,900
Cattle ..	3,983	8,874	6,632	7,806	11,638	21,412
	130,422	195,080	191,550	246,410	256,141	246,751

* The Returns for 1859 do not specify the value of each class of animals.

The duties levied on live animals are as follows :—

	Imported under National Flag.		Imported under Foreign Flag or by Land.	
	R.v.	c.	R.v.	c.
Donkeys	25	50	30	60
Entire horses whose age is known ..	80	0	96	0
Horses whose age is not known..	120	0	144	0
Horses over 5 years	750	0	900	0
Entire horses or others and mares not 5 years old	200	0	240	0
Goats, with or without kids	10	0	12	0
Kids under 2 years old	6	25	7	50
Thibet goats	1	20	1	45
Young pigs, 6 months old, not fatted (sucking).. .. .	17	50	21	0
Ditto, over 6 months	60	0	72	0
Lambs under 1 year	6	25	7	50
Sheep	8	75	10	50
For breeding purposes and improving wool, from Germany and England	0	10	0	15
Mules	100	0	100	0
Calves under 2 years old	30	0	36	0
Oxen of any age, young bulls and cows from 2 to 3 years old	60	0	72	0
Bulls and cows over 3 years old ..	70	0	84	0

Breeding and nature of the Spanish live stock.

Asses.—The number of asses in this country proves the general utility of this animal. There does not appear, however, to be any peculiarity in the race to distinguish it from that of other countries, but it is decidedly treated with greater consideration, chiefly, it may be presumed, on account of its supplying the race of mules. The large jackass is rare and very valuable, being destined exclusively for breeding purposes, and great attention is paid to this in almost every province. Numbers of mares are set apart for breeding mules, and it is on this account that the native breed of horses is said to have deteriorated, although I think other causes may be assigned for it.

Horses.—The breeding and the race of horses, although it is supposed to be carefully attended to by the State, is of secondary importance, certainly as far as the agricultural interest and necessities of the inhabitants are concerned, to that of mules. There are Government establishments in very many of the provinces, in which there are Spanish and a few English, Arab, and German stallions.

The following is the latest official Return I have seen of the number of horses kept by the State :—

	Spanish.	Arabian.	English.	German.

In the Canary Islands the same Returns give the total number of horses 4,266, mules and asses 11,765, and 20,184 head of cattle, besides 1,551 camels.

There is no doubt that much might be done towards rendering the Spanish horse more fitted for agricultural purposes, and more useful to the population, by a judicious mixture of English and German blood; but enterprise in this respect seems wanting, and the mule, it may be with reason, is preferred. Foreign horses are imported chiefly for carriage and riding uses.

Goats.—The prevalence of this animal in Spain is chiefly owing to the peculiarities of the country. Its hardy nature enables it to support itself in districts comparatively barren, and the want of pasture in nowise affects its increase. It is not surprising, then, that amongst a peasantry so poor an animal which costs but little to keep, and which affords a certain amount of nourishment, should abound. The race is the common one. Thibet goats are rare.

Pigs.—Pigs thrive and are bred to a great extent. The state of agriculture, however, is not favourable to the improvement of the races, and the valuable properties of the pig in farming economy are not appreciated. The indigenous breed is a very ordinary one, and inferior, I should think, to its neighbour in Portugal, the red pig. Attempts have been made by individuals to cross it with the Berkshire, Essex, and other English breeds, but with what success, as far as regards permanently improving it, I am unable to state. If properly fed and cared for pigs would become a source of much greater profit to the farmer than at present. The race is capable of great development. There are large tracts of country affording excellent natural food, which could of course be turned to good account on the adjoining cultivated land.

Sheep.—I need scarcely say that the merinos are the predominant race of sheep in Spain. The origin of the race seems to be a disputed question; but whatever it may be, it is certain that it existed as early as the thirteenth century, and was celebrated for its wool, which formed one of the principal sources of the wealth of the country. Other causes than the deterioration of the race may be assigned for the gradual depreciation of Spanish wool since that period. The country is eminently adapted for sheep breeding, and the breeds might be brought to the greatest perfection. Experiments in crossing have been tried with South Downs and other English sheep, and, doubtless, if persevered in would produce most satisfactory results.

Cattle.—In cattle Spain is deficient. The races which exist are by no means bad or ill-adapted to the climate and country. Great interest is taken in breeding bulls for the bull-ring, but it extends no further, and cattle do not seem be regarded, as in other countries, as of any great importance to the alimentary necessities of the population. The relation between live stock in general and land does not

seem to be understood, and the neglect, perhaps, of the one is consequent on the neglect of the other.

The result of these observations seems to be that a live stock, numbering 36,622,315 head, and consisting of races well adapted to the climate, soil, and necessities of the population, is a basis upon which a most flourishing industry could be reared. Although the population has doubled, the live stock remains much what it was in 1756, and this is sufficient proof that if Spanish meat, milk, cheese, butter, and wool can no longer be brought to a profitable market, it is not on account of any deterioration in the sources of production, but from their neglect and want of care bestowed upon their development by the population itself.

(Signed)

L. S. SACKVILLE WEST.

Madrid, April 29, 1866.

SINCE sending in my Report upon the coal-fields of Spain, I have been furnished with some further information respecting the extent and quality of the produce of some of the seams about San Juan de las Abadesas.

The locality alluded to is near San Juan, and at the head of the Torrente de Coll de Jon, a tributary of the River Ser, on the road between Agasa and Ribas. Being in the vicinity of the line of rail from Granollers to San Juan de las Abadesas, it appears to have been thought worth while by some parties to have this district surveyed, and it is from the Report of the gentlemen who surveyed them that I have obtained this information. The following is a section :—

				Mètres.	Mètres.
North Series of Coal Seams	{	Coal..	1·00	—
		Stone shale	—	3·00
		Coal..	2·50	—
		Stone shale	—	3·00

		Coal..	1·50	—
		Stone shale	—	0·70
	{	Coal..	1·00	—
		Stone shale	—	0·60
		Coal..	0·80	—
				19·60	268·80
The distance between the Middle and South seams				—	425·00
South Series of Coal Seams	{	Coal..	6·00	—
		Stone shale	—	7·50
		Coal..	2·00	—
Total thickness				33·60	708·80

This section is properly that of the Veterano mine, which is in proximity, but it is supposed that the north and middle series extend through the district alluded to, called Antorcha, and the Middle Series through that called Diadema.

The North seams are put down as containing 3,600,000 tons of coal, and the Middle 6,480,000 tons: 20 per cent. loss must be calculated upon. There would, therefore, remain 8,064,000 tons of marketable coal; and taking the annual consumption at 100,000 tons, this coal would last for eighty years.

The whole of the seams, as far as they have been

proved, are very soft, and the coal will probably always have to be sold either as small coals, coke, or patent fuel. From what is known of the North seams, it appears that they will not bind, and therefore are not fit for coking, but are capable of being made into patent fuel, or sold as factory coal for steam purposes. The Middle and South seams bind, and are therefore capable of coking.

The Report then goes on to give an estimate of the probable cost of opening these districts, which is set at 79,820*l*. The cost of extraction, supposing the whole of the openings made, and the mines in full work, producing 300 tons per day, is estimated at about 8*s*. per ton, but it could not be brought to the Barcelona market under 16*s*. per ton.

The soft quality of the coal, however, precludes the possibility of selling it as hard coal, and the cost of coking is estimated at 21*s*. per ton. It could, therefore, be sold at Barcelona, including carriage, for 28*s*. or 29*s*. per ton. English coal fetches 40*s*. per ton; English coke, 60*s*. per ton.

Now it would appear from this Report that if the capital necessary for opening the mines were expended, the profits would be considerable according to existing prices. Thus, taking the selling price of the coal at Barcelona at 20*s*. per ton as small coals, there would be a profit of 3*s*. The selling price of coke is 50*s*., and it could be made and brought to Barcelona for 29*s*. The selling price of patent fuel is 30*s*. per ton; from the mines it could be delivered at Barcelona for 23*s*.

It is evident, therefore, that in order to make these mines profitable, the coal must be made into coke and patent fuel, and there would as yet scarcely be market for the amount which could be made.

Grand Duchy of Baden.

*Report by Mr. Baillie, Her Majesty's Secretary of Legation,
on Commerce and Industry.*

Baden, July 4, 1866.

THE scarcity of money, and high rate of discount, the low state of prices for all articles of agricultural produce, and the deficiency of water in the Rhine and its tributaries, were among the principal causes which impeded the course of trade and industry during the past year 1865.

The stagnation of business was, however, most felt during the first half of the year, because in addition to the above causes, the ultimate result of events in America was still wrapped in uncertainty, and the operations of many branches of industry were confined within the narrowest possible limits previous to the 1st of July, at which period the reduced Zollverein Tariff, in accordance with the French Commercial Treaty, was first to come into force.

In the latter part of the year the spirit of enterprise revived, and business was carried on with much greater activity. The Ettlinger and other cotton-spinning establishments which had suffered severely from the cotton crisis, found themselves at the end of the year in relatively much better circumstances.

The exports to America attained some importance, especially wine, manufactured goods, chemicals, leather, and various other articles. The American market is, however, still closed to Zollverein cigars, owing to the enormous import duties in that country.

The vintage and tobacco harvest were most luxuriant, and the large purchases which have been made promise a remunerative sale owing to the peculiar excellence of the produce.

Trade at Mannheim.—The total amount of goods on which Customs duty was paid at that port, and discharged, amounted to 527,832 centners, and the amount of such goods imported direct, and forwarded in transit, or announced for warehousing, 679,514 centners.

The Zollverein receipts yielded—

				Fl.	kr.	Fl.	kr.
1. Goods duty :							
a.	Imports	1,157,555	58		
b.	Exports	485	23		
				<hr/>		1,158,041	21
2. Tax on sugar :							
a.	Colonial sugar refineries	7,439	21		
b.	Beet-root sugar factories	373,965	45		
				<hr/>		381,405	6
Total				1,589,446	27

Compared with 1864—

Goods duty	1,252,757	7		
Tax on sugar	544,582	9		
	<u> </u>		1,797,289	16

Receipts in 1865 accordingly less by .. 257,842 49

The cause of this diminution is partly the smaller returns from the tax on beet-root, and then also the reduction of the import duties on various articles from July 1, 1865.

Coal.—The great development of South German industry and the high price of wood, have caused a demand for coal, which is rapidly on the increase.

The price of coal at the mines has risen 25 per cent. above that of the preceding year.

Notwithstanding various impediments to the trade, 3,657,541 centners of coals and coke, conveyed by water, were imported into Mannheim in 1865, against 2,785,160 centners in 1864.

With the addition of the coal conveyed by railway, the total amount of the coal business at Mannheim last year is estimated at 5,000,000 centners.

Since the opening of the harbour at Maxau, on the Rhine, a few miles distant from Carlsruhe, and the construction of a bridge over the river, it is not improbable that the coal trade direct to that port will assume some importance.

In 1865, 96 vessels, with 582,876 centners of Ruhr coals, discharged their cargoes in Maxau, of which 144,400 centners were for the railway service, and the rest for the coal merchants.

Since the outbreak of the war between Prussia and the Germanic Confederation, it appears that the exportation of Prussian coal into the South German States has been prohibited by the Prussian Government.

Such a prohibition, if long continued, would of course be most ruinous to the industry of the Grand Duchy, which is almost entirely dependent on the supplies of coal from the Saar and Ruhr mines ; but as matters stand at present, it must be recollected that trade and industry are almost at a complete standstill, and consequently the demand for coal for manufacturing purposes must be very small. Secondly, the stores of coal for the railway service, which I understand are considerable, will go further than they would under ordinary circumstances, inasmuch as the price of wood has fallen about one-half, and can consequently be employed as fuel in conjunction with or instead of coal.

Finally, the Saar coals can be obtained through France at no great expense by canal, unless, indeed, the war should be prolonged and the exportation of coal prohibited by the French Government as contraband of war.

Salt.—From the salt works of Rappenu and Dürrheim the average annual quantity of salt obtained amounts to upwards of 320,000 centners.

Mannheim imports about 6,000 centners, in value 25,000 florins.

The tax on the consumption of salt yields a net revenue to the State of about 1,100,000 florins annually.

Iron and Metals.—The trade in iron and metals during 1865 remained much in the same condition as in the preceding year.

The scarcity of money operated unfavourably upon the trade and checked speculation. The prices were, however, maintained, and even partly rose.

The demand for zinc and lead was larger than the supply.

The prices of copper were driven up, owing to the failure of adequate supplies, in consequence of the dispute between Spain and Chile.

The Commercial Treaties with France and England have as yet been little felt in Southern Germany ; at any rate not in a way disadvantageous to this country.

The prices of rolled bar and bar iron have not improved.

The demand for cast iron has increased, and prices during the last year were favourable.

There was less business done in English cast steel, and the German manufacture is becoming more appreciated.

The French Commercial Treaty already exercises an influence on the trade in coarse small iron wares.

Owing to the reduction of the import duties on such goods from 10 thalers to 4 thalers per centner, the Zollverein market is now opened to the French industry, and many articles of this description from France, being remarkable for their workmanship and cheapness, are more in demand.

The trade at Mannheim in manufactured iron and metals amounted in 1865 to about 250,000 centners, in value about 1,750,000 florins, of which about a tenth part was consumed in the town, the remainder sent to Baden and the neighbouring countries.

Manufacture of Machinery.—The number of establishments in Mannheim has risen to eight, employing altogether 350 workmen.

The total consumption of raw, cast, wrought, and rolled iron amounts annually to about 25,000 centners; wages to 150,000 florins.

In Carlsruhe, the Maschenenbau Company transacted business to the amount of 1,260,000 florins, employing an average number of 906 workmen.

Agricultural Machines.—The importation of English and American threshing, mowing, sowing, and hay-making machines was very considerable last year, and the demand appears to be rapidly increasing.

Porcelain and Glasswares.—This trade has improved, principally owing to the recent Commercial Treaties, which have partly promoted exportation to countries where before there was scarcely any opening, as, for instance, to France; partly also from reduced import Customs duties, increased the importation to Germany.

German porcelain now finds a market in France, Switzerland, Italy, America, and other countries. The finer kinds from Paris, Limoges, also from Bohemia, are imported to Mannheim, and there gilded, painted, and decorated. Baden, Saxony, Bavaria, and Silesia furnish both ordinary and superior painted and unpainted porcelain. Coloured glass comes chiefly from Bohemia.

Wine.—The vintage of 1865 in respect to quality is said to have been superior to any other in this century, the year 1811 alone excepted.

The quantity, however, was only a third of a full vintage.

The wine trade in Mannheim is on the increase. Prices last year exceeded those of the celebrated years 1834, 1842, 1846, and 1857 by 50 per cent., and partly even 100 per cent.

More than two-thirds of the vintage is already bought up.

The wine exports were very considerable, especially in the latter half of the year, because the States subject to the transit duty waited until after the 1st of July for supplying their requirements, in order to reap the advantage of the removal of that duty.

The exportation to America has also increased since the termination of the war.

The effects of the Treaty with France, which reduced the Zollverein import duties from 14 and 10½ florins to 7 florins, have not been as yet much felt, because a vintage so singularly fine as that of 1865 compels the northern wine merchants to purchase, and prevents any immediate diminution of the white wine business. However, the large importation of French red wines would seem to indicate that the taste for such, encouraged by the low prices, is rapidly increasing, and if such should prove to be the case no doubt the consumption and value of Baden wines may be to a certain extent reduced.

French red wines have already been largely imported into Southern Germany without much affecting the native produce. Many of the Baden wines will be improved by an admixture of French red wines, and their value probably increased, as I have already pointed out in a previous Report on the wines of this country.

The red wines of the Berg-Strasse obtained last year very high prices—from 80 florins to 100 florins per ohm.

The wine trade in Carlsruhe represents about 12,000 ohm, of which about 8,000 ohm are consumed in the country; the remainder in the Zollverein and foreign countries.

The Carlsruhe Commercial Chambers report that the fine quality of the Baden red wines was fully appreciated at the International Exhibition in Cologne, and they urged it as pretty certain that the result of that Exhibition will be most favourable in its effect upon the wine trade of this country.

Beer.—The increase in the consumption of beer is very great. There are in Mannheim 14 breweries, carried on by two Companies, representing respectively 300,000 florins

and 250,000 florins capital. The excise on beer yielded 50,004 florins. 6,601,000 maas were produced in 1865, against 5,802,040 maas in 1864.

Colonial Goods Trade.—This trade during the last ten years has attained great importance; and in this branch, Mannheim may be reckoned among the first-class inland commercial towns.

Coffee.—78,506 centner of coffee were imported and passed the Mannheim Custom-houses last year.

The purchases, contrary to the usual practice, were chiefly made in England. The market there, owing to the exchange being unfavourable, and the imports very considerable, was more reasonable than in Holland, where the imports of coffee were some 12,000 tons less than in 1864.

The coffee trade to Austria—originally depending on the natural situation of Mannheim, as being the shortest route from the Rhine to the navigable Danube—has now been withdrawn to some extent from that port, in consequence of the cheaper direct freight charges on the Liver from the Northern and Baltic ports to Vienna, in addition to far greater rapidity.

Unless, therefore, greater facilities of transport, both on the Rhine and by railway, than at present exist, are provided, it would seem that the Mannheim trade is in danger of losing much of its importance.

Manufacture of Sugar.—The condition of the sugar business is unsatisfactory, and prices as low as ever. The cause is, the overproduction of Zollverein sugar. The Zollverein sugar industry has become so large, that unless a wider market for its exports is opened up, it cannot be further developed, but must, on the contrary, decline.

The production of the Waghaüsel factory was increased last year, but without proportionably remunerative returns.

In the business year 1864-65, 14,470 loaves of white sugar more than in the preceding year were produced.

Credit and Money Market.—The year 1865 has been especially characterized by the enormous investments of capital in United States' bonds, in connection with the termination of the American war, and also by the high rate of interest which developed itself in the course of the autumn, and lasted to the end of the year.

It is estimated that American Government paper to the amount of 250,000,000 to 300,000,000 dollars are at this moment in European hands.

The monetary condition of Baden is very much a miniature of that of Europe in general.

Capital here, as everywhere else, poured into American securities; whereas Austrian funds, which yielded as high or even a higher rate of interest, have been more and more deserted.

Investments in South German funds have also much diminished, and Baden Government paper chiefly employed for inland objects only, has sustained considerable depreciation.

The actual money market has been also affected in a high degree by the same cause.

It is true that the high rates of discount at the commencement of the year soon disappeared, and borrowers on discount paper and other securities were able to take advantage of the reduction.

It was, however, almost impossible to raise money on mortgages, and merchants could obtain no advances for commercial or industrial investments except on ruinous conditions.

In consequence of the large importation of American securities to Germany, the prices of foreign bills of exchange rose to an unusual height. As Germany was unable to pay for this importation by an equally large exportation of goods, there was evident danger that silver would leave the country. This, in fact, took place; and as the silver exports were accompanied by the large demands for money which always take place in the autumn, the banks one after the other were obliged to raise their rate of discount.

At Mannheim, for local bills of exchange, the rate varied from 5 to 6½ per cent.

The total business in securities, bills, and in the money market was very considerable, and bears witness to the progressive prosperity and commercial importance of Mannheim, which was comparatively little affected by the disturbing influences of the year 1865.

Textile Industry.—The Commercial Treaty with France has not as yet produced the effect that was anticipated, of increasing the trade with France in articles of textile manufacture.

More, indeed, of the finer description of French fabrics have been imported; but not of the middling and coarser goods, which form so important an element of commerce.

The fact is, that the manufacturing industry both of France and the Zollverein is now so advanced that the Tariff, though reduced, still acts as a barrier to a great many articles.

The duties must be still further lowered before a large trade can spring up between the two countries.

The Zollverein industry has but little to fear from foreign competition, and much less even from England than is generally supposed.

Half-woollen stuffs, such as Orleans, mixed and façonné goods, which before July 1, 1865, were protected by a duty of 30s. and 50s. per centner, but can now be imported into this country at 20s. per centner, have, in spite of the reduction, been chiefly ordered from Zollverein factories instead of from England.

Such instances show how little ground there was for the apprehensions of the German Protectionists in respect to the French Treaty.

Even the spinners are now obliged to acknowledge that, even with the reduced duty of 2s. on cotton yarns, their business will not suffer any injury.

Ettlingen Spinning and Weaving Manufactory.—The number of spinning and weaving looms and other machines in this establishment underwent no change last year.

The fears that a further reduction of the number of workmen would become necessary were also not realized, inasmuch as the termination of the American war rendered it possible to obtain cheaper cotton, and in larger quantities, as also to regulate the prices, for the sale of manufactured goods, in a way that could not be done during the war.

The number of workmen at the end of 1865 was about 1,500, and would soon have increased had not the disturbed condition of the continent gradually put a stop to trade and industry altogether.

(Signed)

EVAN P. M. BAILLIE.

Hanover.

*Report by Mr. Doria, Her Majesty's Secretary of Legation,
on Commerce and Statistics.*

July 9, 1866.

THE Commercial Returns for the year 1864 give the latest statistical information relative to the imports and exports traversing the Kingdom of Hanover.

To the courtesy of M. von Klench, of the Finance Department, I am indebted for the Returns from which the following statement has been drawn up.

These Statistical Returns of the principal articles of exportation and importation, as shown in the annexed Tables marked Nos. 1 and 2, do not properly represent the amount of merchandize which has been exported or imported by Hanover itself, either for its own internal consumption or as produced in the country, but they show what amount of merchandize has passed over the Hanoverian frontier, whether in transit or destined to remain in the country. Hanover, from its geographical position, possessed of railroads and rivers direct to the ocean, must necessarily be a country of transit for merchandize passing to and from many of the Zollverein States. With regard to exports, by far the greatest quantity has been forwarded to Hamburg and Bremen, but beyond those towns I have no means of ascertaining their ulterior destination; some small proportion of the exports are noted as crossing the Hanoverian frontier to the Netherlands and Mecklenburg.

The total amount of export dues from the Zollverein States for the year 1864 amounted to 163,488 thalers, equal to about 24,513*l.* sterling. The total amount of import dues levied on articles entering the Zollverein States in the same year amounted to 24,437,803 thalers, or about 3,665,670*l.* sterling. With regard to the amount of duties levied on these exports and imports, which belonged exclusively to Hanover, I have no means of obtaining correct information. This arises from the system established for the levying of duties in the Zollverein States, many of which have no exit to a foreign country

not included in the Zollverein. Much merchandize is forwarded through Hanover to Bavaria and Saxony. Hanoverian produce is exported through Prussia to Holland and Belgium, and merchandize destined for consumption in Hanover is imported also through Prussia; it is, therefore, impossible to arrive at any precise statement of the amount of goods produced in or destined to be consumed in the Kingdom of Hanover. Many articles not subject to duty are not noted in the Custom-house books, and the Custom-house authorities must trust, moreover, to the statement made by the exporter as to the quantity, as they are not authorised to verify the quantity by inspection.

The exportation of wheat and various other seed, over the Hanoverian frontier, used for food, amounted to 608,501 centners. The amount of wheat and other seed imported equalled 461,252 centners. If the quantity exported is deducted from the quantity imported, it leaves 147,249 centners excess of export over import for the year 1864.

As I have already explained, what quantity of grain was produced on Hanoverian soil, or how much of it was consumed in the country, cannot be ascertained. It may, however, be stated that Hanover exports nearly every year a large amount of various sorts of grain.

To continue with articles of consumption exported: vermicelli, arrowroot, flour of various sorts, rice, equalled 177,280 centners. The quantity of butter equalled 21,358 centners. The marshes on the Rivers Elbe, Weser, and particularly the Ems, are famous for the pasturage they afford.

The next figures which are worthy of attention in the list of exports are those bearing reference to mineral coal, which represent the amount of 1,401,057 centners, or 68,950 English tons, of which 1,248,846 centners were sent to Bremen, and of the whole quantity 77,731 centners were sent to Hamburgh, but the amount of coal imported as mentioned in the same Returns, gives the following number of centners, viz., 1,919,023, thereby reducing the quantity exported, if subtracted from the quantity imported, to 517,966 centners excess of import over export.

The coal from the mines in Hanover is not exported beyond the Zollverein; it is consumed either in the country or in the neighbouring States. The coal which is

exported over the Hanoverian frontier comes from Westphalia. This coal has monopolized the market on the Weser, and will eventually obtain the same advantage on the Nieder Elbe, as soon as the railway from the Rhine to Hamburg viâ Osnabruck is completed. The importation of English coal is almost entirely confined to the Nieder Elbe.

The exportation of tobacco and cigars amounted to 152,364 centners. The imports of the same were 554,316 centners. Of snuff 677 centners were exported, and only 26 centners were imported.

The excess of import over export with reference to iron and iron goods is again unfavourable to exports. The amount of iron of various sorts exported was 205,926 centners. The amount imported was 291,521 centners, of which quantity 4,389 centners were rails for the construction of railways.

I reserve for future inquiry for a subsequent Report, the condition and number of iron mines in Hanover, and need only remark, that the Georgs Marien Bergwerk and Hutlen Verein, in the vicinity of Osnabruck, is the most productive iron foundry in the kingdom. In the Hartz district the most worthy of mention are the mines and founderies of Altenau, Königshutte, Rothhutte.

With regard to the Royal Iron-works, it is intended to diminish the production of bar-iron, and to increase that of raw iron, cast-iron goods, and steel, because the unfavourable state of the market has caused great heaviness in the sale of bar-iron, and also on account of the high market price for wood. They now try smelting with coal and coke.

The amount of iron-ore imported is very insignificant, 37 centners, or 3,700 lbs. English. No iron-ore appears to have been exported.

The importation of linens reached 24,984 centners, but the comparison with the quantity exported shows a favourable result in favour of the exports, the amount being 44,992 centners; to which must be added 2,706 centners for linen yarn and thread, making the excess of exports over imports in this instance nearly double.

With regard to wool and woollen manufactures, the excess of exports over imports is again in favour of the exports, as shown by the following figures; exports, 79,000 centners; imports, 39,380 centners: to which has to be added a further excess of 121 centners in favour of exported wool, under the head of carpets, which are

represented as 581 centners exports and 460 centners imports.

Of horses and cattle 41,421 head were exported; of pigs, goats, and sheep, 46,680.

The number of imported cattle and horses equalled 15,409; the number of goats, sheep, and pigs, was 6,736.

From Table No. 3 may be seen the number of the various commercial and industrial establishments existing in the Kingdom of Hanover, as derived from the Statistical Report for the year 1864. Besides the persons and the workmen employed in those establishments, Table No. 4 shows the number of persons of various trades who are working on their own account.

From the two next Tables marked Nos. 5 and 6 may be seen what amount of merchandize was dispatched by railways in the Kingdom of Hanover during the time from July 1863-64 to July 1864-65, which shows a very considerable increase.

The Estimate of the sums voted by the Chambers for the public expenditure, and the different sources from which the revenue of the Kingdom of Hanover is derived, may be seen from the Table marked No. 7.

From the public revenue the King receives nominally the sum of 600,000 thalers, besides the interest of 600,000*l.* sterling belonging to the Crown of Hanover, which is invested in the public funds in England. This sum does not appear in the Budget as shown in Table No. 7. The King has made use of the right granted him by the Constitution to take land belonging to Government, the administration of which is in the hands of persons appointed by himself, the rent of which is valued at 444,000 thalers; the residue is paid from the revenue of public or Government domains. The Crown Prince receives from the same source 30,000 thalers, or 4,500*l.* sterling annually, which is voted by the Chambers.

(No. 2.)—TABLE of Articles Imported over the Hanoverian Frontier, 1864.

Articles Imported.					
					Centners.
Refuse from tanneries	23,124
Raw cotton	182,695
Cotton yarn, mixed and unmixed	10,094
Cotton yarn, ditto, ditto, of three and more threads	998
Cotton goods, of cotton and linen mixed	8,759
Raw lead	1,217
Leaden goods	210
Ditto, fine	1
Chemicals, for medicine and manufactures	9,277
Sal ammoniac	444
Castor oil	19
White lead	499
Iron vitriol, from Austria	1,473
Madder	606

Articles Imported.					
					Centners.
Aloes and gall apples	6,400
Resins	19,255
Saltpetre	33,867
Brimstone	91,370
Avignon pears, palm-nuts, &c.	70,112
Indiarubber	5,937
Gutta percha	212
Wood, not European	30,494
Indigo	4,904
Sea grass	2,301
Mineral, animal, and vegetable products	79,180
Vitriolic acid	26
Woods for dyeing	26,466
Ditto, reduced to powder	3,220
Vermilion	466
Copper vitriol	2,538
Soda	12,707
Potash	23,729
Iron, of all sorts	245,588
Wrought ditto, and rolled	15,038
Railway rails	4,389
Raw, cast, and refined steel	6,222
Iron bars of less than $\frac{1}{4}$ square inch Prussian	5,517
Iron of different shapes	14,771
Tin and sheet iron	3,308
Coarse cast iron, &c., ware	88,222
Coarse iron and steel ware	48,042
Fine ditto	1,044
Iron ore	37
Flax, oakum, tow, and hemp	34,495
Wheat and other kinds of corn	34,285
Beans, peas, and lentils	20,037
Rye	303,213

(Signed) WM. DORIA.

Mexico.

*Report by Mr. Middleton, Her Majesty's Secretary of
Legation.*

Mr. Middleton to Mr. Scarlett.

Sir, *Mexico, January 10, 1866.*

THE subjects which I have chosen for the half-yearly Commercial Report, which I have the honour to inclose to you herewith, and which I have drawn up in conformity with the instructions contained in the Earl of Clarendon's circular despatch of the 24th of February, 1857, are the cultivation of the maguey plant in the Mexican Empire, and that of the cotton plant in the provinces situated upon the Pacific coast.

I have also the honour to transmit to you herewith, in obedience to the instructions contained in Earl Russell's circular despatch of the 24th of January, 1860, a Report upon the Finances and Public Credit of the Mexican Empire.

I have, &c.

(Signed) **R. F. C. MIDDLETON.**

Inclosure 1.

Report on the Commerce, &c., of Mexico.

Mexico, December 20, 1865.

AMIDST the vegetable productions which most excited the attention of the Europeans, who first set foot upon the Mexican Continent, was the plant *Alexandria Monogynia*, according to Linnæus, denominated by the Aztecs, "Metl," and by the Spaniards, "Maguey," probably from the latter having been the generic name amongst the natives of Hispaniola, or Santo Domingo, for the common aloe, which plant, although somewhat like it, is, however, by no means to be confounded with the maguey, which belongs to the

family of the agave, a name derived from the Greek word "agavus" (*αγавος*), admirable.

The maguey is "the tree of wonders" ("el arbol de las maravillas"), says the Monk, José Acosta, who visited Mexico in the year 1586, in his "Natural History of the Indies," published at Madrid in 1608; and up to the present day it may be considered, in its numerous varieties, as one of the most important productions of the Mexican soil.

The beverage produced from it denominated Pulque, to which I cursorily alluded in a former Report, was, as it would appear, well known to the ancient inhabitants of the Mexican Continent from the fabulous traditions connected with it, and which were collected by the missionaries who came to the country in the early days of the Spanish occupation; one of these is the destruction of a race of giants indigenous to the Valleys of Atozac and Matlacueque (Ilaxcala), and of cruel propensities, by more civilized races, who had come to settle there; the former having fallen asleep from the somniferous effects of the juice of the maguey, whilst the discovery of the juice itself, whether under its ancient denomination of "Metl," "Agua-miel" (honeywater), or Pulque, was attributed by a portion of the ancient inhabitants of Mexico to the God Izquitecatl, as would appear from various symbolical inscriptions found in the country. More modern tradition has fixed the epoch of its discovery as having been about the year 1045 to 1050, under the reign of the eighth King of the Taltec Tribe, named Tepanalcztin, at whose Court, a relation of his, named Pepantzin, presented himself and informed him that his daughter had discovered that a sweet and aromatic liquid sprung forth from the metl plants in her garden. The King ordered her into his presence, and she brought him a "Tecomatl," or vase, of the liquid she had discovered, which he tasted, and then ordered her to bring him more; and subsequently becoming enamoured of the maiden, whose beauty was great, and whose name was Xochil, or "flower," he married her; of which union a child was born, to whom was given the name of Meconetzin, or "son of the metl," or maguey, in allusion to the circumstance which was the origin of his parent's first interview.

Whether the discovery of the use of the juice of the maguey be really to be attributed to the God Izquitecatl, or to the Queen Xochil, there is no doubt that the divers properties of the plant itself were known many years

before the discovery of Mexico by the Spaniards ; for, not only is it mentioned as furnishing thorny scourges, as well as whips made of the fibres of the plant's leaves, for the multitudes who annually met to celebrate a festival in honour of the God Texcatlipuca in the great Temple of Tenochtitlau (the modern Mexico), but the use of the juice became so general, that many severe laws against the drunkenness resulting from it were issued by the ancient Mexican Kings, mention being made of a widow who sold it promiscuously having been put to death by order of the King Netzahualcoatl ; only women suckling infants, old people, and soldiers upon the march being allowed to drink it.

As we have before said, notwithstanding that the primary object of those Spaniards who came to Mexico in the earlier periods of its subjection was to search for the precious metals, the maguey plant also occupied their attention very considerably, especially when increased intercourse with the natives revealed the variety of uses to which the plant was put by them, and it was lengthily treated upon by the authors of the time, although, from similarity of form, it was not unfrequently confounded with the common aloe, and even sometimes considered to be a gigantic species of the thistle or cardon.

The following description of the plant is taken from the narrative of a gentleman in the suite of Ferdinand Cortes ("Relacion de un Gentilhombre de la comitiva de Hernan Cortes"), published at Venice in 1606 :—

"A plant exists in this country (Mexico) which is at once a tree and a thistle ; the leaves are as wide as the knee, and longer than the arm ; a stem springs from the centre of it, which attains to two or three times the height of a man, and its bulk is that of a child six or seven years old. When it is ripe the Indians cut the stem at the bottom, which produces a juice which they drink to excess, losing their senses and falling to the ground. This plant is of extreme utility, for it produces wine, vinegar, honey, and a beverage resembling cooked grape juice (pulque under some of its varieties). It also serves for the manufacture of garments for both sexes, of shoes and ropes, and is also used as roofing for houses. The natives also preserve the leaves of this tree or thistle, which is as much esteemed by them as the vine is by Europeans ; from which leaves, after toasting them in ovens dug in the ground, and drawing out the fibres, they manufacture a drink (mezcal,

to which allusion is made further on), with which they intoxicate themselves. The natives call the plant the maguey."

Ferdinand Cortes says, in the second of his letters to the Emperor Charles V, in describing the market of Tenochtitlau (Mexico), "They (the natives) sell honey made by bees and honey made from maize stalks, which are as sweet as the sugar-cane, and also honey made from the plant, the maguey, and from this same plant they also make sugar and wine."

To the various uses to which the maguey plant was turned by the ancient Mexicans, and which were so much commented upon by the writers of the period, may be added that of the making of paper from the skin of the leaves, many curious old documents still existing of that material, as well as the manufacture of a kind of soap from the root. As to the extent of the lands appropriated to the culture of the plant the writers in question give scanty information, but still sufficient to show that it was cultivated on an extensive scale in the States of Tollan, of Texcoco, and Mexico, as well as in the independent Republics of Tlaxcala, Tluexcingo, and Cholula, and other districts of the Valleys of Puebla and Mexico, where the vassals paid a great part of their tribute-money in clothes and sandals made of "ixtli" or maguey fibre, and it is worthy of observation that the above-mentioned districts were the most thickly populated of the ancient Mexican territory, which is stated, perhaps somewhat vaguely, by the old Spanish writers to have contained more than 30,000,000 inhabitants.

Dr. Hernandez, a botanist, who was sent to make researches in Mexico by Philip II in the year 1570, makes mention of ten different species of the maguey plant as existing within the Mexican territory, assigning to each, under their Indian names of Metl Coztl, Mexcalmetl, Mexocatl, Nequametl, Tepemexcalli, Tlacametl, Teometl, Pati, Quetzalichtle, and Kalometl, some peculiar medicinal properties or domestic uses, whilst ancient tradition, as well as the assertions of such of the rural population as are employed in this branch of agriculture, testifies to the existence of thirty different varieties of the plant in the chief maguey producing district of the Plains of Apam (Llanos de Apam) alone, which district is situated in the States of Mexico, Puebla, and Tlaxcala.

As ten of these varieties of the plant yield neither juice

nor fibre, and are only useful for making hedges, it is unnecessary to mention them by name. The remaining varieties are as follows:—

Metometl produces little juice, and rather bitter, but is the best variety of the plant for thick rope fibre, and the ashes of the trunk produce mezcal.

Mechichitl produces a sweet and yellow juice from which pulque is made.

Cimarron Blanco produces little juice, and thick and frothy.

Cosmetl Blanco produces little juice, but sweet and excellent for the manufacture of pulque and mezcal: its fibre well-adapted for making thin ropes.

Izmetl Cimarron possesses the same characteristics as the preceding variety, except that it produces juice during three months, whilst the foregoing only produces it during two months.

Necuametl, juice bitter, but not too much so to allow pulque to be made from it.

Mechichitl Superior, yields sweet juice in abundance, and during four months.

Soxatic produces excellent sweet juice, full of saccharine matter, and fit for making the best pulque, like the preceding variety.

Maguey Verde, of a finer quality than the preceding varieties, yields a rather bitter juice, but from which a strong description of pulque is made.

Magney Manso is held in the highest estimation, producing a milky, thick, and very sweet juice, from which superior pulque is manufactured.

Mepichahnac, yielding thick and good, though rather acid, juice.

Metotatl. Idem.

Metometl. Idem.

Sosometl Cimarron produces greenish juice, but clear and sweet.

Mecuametl produces a yellow and sweet juice during five months in the year.

Cimarron Verde produces good juice, but only during two months in the year.

Tenexmetl produces thick juice, containing much saccharine matter.

Manso legitimo. Peculiar to the district of the Plains of Assam, upon which it attains to an immense height and a wonderful development. Its juice is abundant, and of the

sweetest quality, the yield lasting six months in the year: 100,000 plants of this species of the maguey are worth a silver mine, so says the Mexican adage.

Istametl, called salad by the natives, owing to the peculiar flavour of its juice.

Sagometl, yielding but little juice.

Humboldt and Skunth classify the maguey plant amidst the *bromeliaceæ*; Sprenges and Decandolle amidst the *liliaceæ*; but Lindley, in his "Vegetable Kingdom," considering the peculiar characteristics of the former class to consist in its calyx, and from the *liliaceæ* possessing no adhering ovaris, declares the maguey plant to belong to the narcissus tribe, order of the *amaryllideæ* and *agaveæ*.

The plant may be cultivated to a height of 10,000 feet above the level of the sea, but is cultivated with greater success at a somewhat lower elevation, about 9,000 feet, but ceases altogether to grow at 5,800 feet. It requires an average temperature of 15° (Reaumur), and flourishes from that to 26°, the most favourable quantity of humidity in the air being about 35° to 50° of De Saussure's hygrometer in dry weather. For the complete development of its flowers it requires about 62 degrees of heat (centigrade) as a diurnal maximum. The juice of the plant is the least mucilaginous in a somewhat clayey soil, but, if the soil be too dry, so many mucilaginous particles are secreted in the juice that an inferior kind of pulque, called "ilachique," can alone be manufactured from it.

Whilst the maguey plant is grown in the Valley of Mexico itself, in that of Toluca, in that of Puebla, in that of Texcoco, in Pachuca, in many districts of the States of Oaxaca and Tehuantepec, Queretaro, Guanajuato, and Michoacan, at St. Juan de los Llanos, Cuatla de Amilpas, Huichapan, Tulancingo, and in many other places in the Mexican Empire, which it would be tedious to specify, and also, to a more limited extent, in the States of San Luis and Tamaulipas, and that particular species producing "henequen," to which we shall presently refer, in Yucatan, the great maguey district is that of the plains of Apam (Llanos de Apam), embracing a range of territory of more than 600 square leagues, almost covered with the plant, either in its wild or cultivated state, and abounding in rich estates.

This vast maguey district is now entirely destitute of trees, although vestiges remain of cedar forests having formerly existed there, the soil being light, stony, and

apparently arid in many places; indeed, nothing can be less agreeable to the eye, or promising in its general aspect, than these, or any other maguey plantations, although so surprisingly productive.

The two year old plant of the best species is commonly valued at about a quarter of a dollar, the four year old plant at 2 dollars, the eight year old plant at 4 dollars, and those of from twelve to fifteen years old at from 6 to 8 dollars; and thus there are maguey growers in the district in question, whose estates are not worth less than some millions of dollars, taking into account the amount of pulque produced. There are few branches of agriculture, indeed, so productive in any country, as is proved by the following calculation based upon a careful study of the subject, taking, as a basis, ground well adapted for the cultivation of the maguey, and an imaginary number of 1,000 plants:—

		Dolls.	c.
Cost of plants, transport, transplanting, &c.	..	250	0
Cultivation during 15 years	100	0
Contributions during the same period	11	2
<hr/>			
Total	361	2

At the expiration of eight, ten, twelve, fifteen, and sixteen years, each of these plants will have produced; and if the return made by each be calculated at only 5 dollars, we find that a capital, which may be estimated at about 400 dollars, will have produced (it is true after a long interval of time) the immense return of 5,000 dollars.

The mode of propagation of the maguey is is extremely simple. Before it dies, the plant leaves a family around it of six, eight, or more suckers, which are left to grow for two or three years, are then dug up with great care so as not to injure the “mezontete,” or stem, and after all the leaves but three have been cut off, the plants are spread out on the ground for two or three months, in order that they may partially dry, for if the maguey be planted too moist it rots, and a destructive worm, called a “chilocuile,” is often generated in it. The young plants are afterwards planted out at little distances apart, and in rows; barley, which is believed rather to favour their growth, being very commonly sown between them. The formation of the leaves of the plant is admirably well adapted for supporting all meteorological variations; a hail storm, which would suffice for the destruction of the maize or corn crop, scarcely leaves a trace of its passage upon their hard

tissue; rain falls off from them, sun does not parch them, neither does frost dry them up, or cause them to wither; and the plant would appear, as it were, to secure just so much of the various elements of the atmosphere around it as is necessary for its nurture and development, and to cast off the rest. It is only towards the close of its life that it begins to exhibit symptoms of being affected by the influence of the different seasons, yielding less juice in cold, rainy, or tempestuous weather. In a good soil, the maguey plant requires a period of from ten to twelve years for attaining maturity, but at least fifteen years in soils of an inferior quality; and thus the capital which it represents, although eventually yielding so high a return, remains unproductive for a lengthened period. The plant upon attaining its full growth, which is easily discernible by its height and the prodigious extension of its leaves, brings forth a tall stem crowned with yellow flowers, and then a certain amount of pruning becomes necessary so as to form a kind of reservoir in the centre; and what is technically termed a "cara" or "face" around it, so as to cause the juice to flow towards the same spot, and to facilitate the extraction of it by removing some of the interior leaves and thorns.

The belief in the efficacy of the medicinal properties of the plant is universal among the Mexican peasantry, to whom it has been handed down from times of remote antiquity; thus the juice of the leaf is said to be a specific for bruises and contusions; the gum which is engendered in the lower part of the stem to cure the toothache, whilst various experiments upon the curative properties of the plant, under different forms, have been made by members of the medical profession in Mexico with satisfactory results.

From the year 1777 to the commencement of the present century the tax levied upon pulque, averaging about 20 cents per arroba (25 lbs.), produced about 800,000 dollars annually; and supposing the value of the beverage to have been from about 50 to 55 cents per arroba, the value of the quantity consumed may be estimated, taking the amount of the tax as a basis, at about 1,800,000 dollars per annum, representing a capital of from 28,000,000 to 30,000,000 dollars. As far as can be ascertained from the meagre statistical records of the time, not more than from 50 to 60 pulque estates existed during the last two centuries; whilst, now, in the several districts of the Mexican table land of Teotihuacan,

Pachuca, Apam, and Texcoco, there are 178, and from 80 to 100 in that of Ilaxcala.

The following is the mode adopted for the extraction of the juice of the maguey plant, and for the manufacturing from it of pulque, which denomination dates from the time of the Spanish occupation of Mexico, the derivation of the word appearing to be totally unknown, the beverage being known under the denomination of "neutli" in the time of the Aztecs.

So soon as the leaves begin to turn yellow, a small concave aperture is scooped out by means of a keen-edged knife, called an "iztetl," in the core of the plant, which is usually from about 18 to 20 centimètres in diameter, and this aperture is gently scraped round, care being taken that no incision be made in the leaves or fibres around it, for fear of imparting a bad taste to the juice; this operation producing a sediment, denominated "raspa," through which the juice, generally known under the technical name of "agua-miel," or honeywater, exudes from the groves of the plant, which juice is extracted by the "ilachiquero," or maguey labourer, by means of an elongated gourd formed into a tube, called an "acocotl," the air in which is exhausted by suction, and which he thrusts into the incision in the core of the plant, stopping the aperture at one end with his finger, and emptying its contents into his "zurron," a sort of impervious sheepskin bag inserted in a net and strapped to his back. Each labourer has, usually, the care of from about 50 to 60 plants, from which he extracts, or as it is technically expressed, "sucks" from about 110 to 120 arrobas of honeywater per week. As soon as his "zurron" is full, he carries it to the "tinical" or pulque manufactory, very commonly returning to each plant and performing the same operation of scooping round the incision and exhausting the juice it contains twice in the day, taking particular care to cover up the aperture with leaves and stones lest the cattle, dogs, or "cagates," a small species of jackal, which infests the country in large numbers, should get at the juice.

As we have before seen, the honeywater varies in quantity, colour, and quality, according to the species of the plant, the producing time of which may be said to extend on an average to about three months, although some sorts only yield juice during a period of twenty days, and other sorts are so exuberant that they yield it during six months, and that in large quantities. The least produc-

tive species of the plant is calculated to yield about 60 arrobas of juice; that of an average description about 80 arrobas, whilst the finest sort of all, the "Manso legitimo" of the Plains of Apam, before alluded to, yields, when it has attained complete maturity, from 140 to 160 arrobas. The average quantity yielded by each plant, one with another, may be roughly estimated at about 100 arrobas.

The "tinicales" or pulque manufactories of the different maguey plantations consist of a long covered-in gallery, well ventilated, and containing rows of vats made of bullock's hide stretched over a modern framework, and smeared over with lime on the outside, into which the honeywater is emptied so soon as it is brought in from the plantations, and which, in about thirty-six hours begins to ferment, casting up large bubbles of froth, losing its pristine transparent colour, and assuming a milky whitish tint which it permanently retains. It was formerly the habit to throw lime or a plant called "Ocgtractli" into the honeywater in order to produce a greater degree of fermentation; but, now, only a small quantity of "madue del pulque," or pulque already manufactured, is poured into the empty vats, which quickly deposits a thick and whitish coloured sediment, upon which the new juice or honeywater is thrown in; the mixture after fermentation being ready for use, is then sent off to the City of Mexico, Puebla, or the nearest market, within a radius of 20 or 30 leagues; the pulque very commonly undergoing a considerable dilution of water by the way at the hands of the "arrieros," or carriers, who convey it in sheepskin bags upon mules or donkeys. The quantity of it which, thus, annually enters the City of Mexico alone, may be estimated on the average to be about 2,000,000 arrobas, and that which enters Puebla to be about 500,000 arrobas, and the cost of transport alone has been calculated, taking the approximate average of 1 real as that of each arroba, to represent the sum of 312,000 dollars; not less than 20,000 mules and donkeys laden with the beverage entering the city every month by the gate leading to the maguey districts. To the quantity paying duty must also be added a considerable quantity which is smuggled in, and including this, it may be calculated that about 50,000,000 bottles are now annually introduced into the City of Mexico, De Humboldt having fixed the number at 44,000,000; and the amount of money annually expended in the drink at

the average rate of about a quarter of a real per bottle to be about 1,600,000 dollars annually; the number of "pulquerias" or pulque stores within the capital (which in the year 1771, when the increasing popularity of the beverage compelled the Spanish Viceroy, Revillagigedo, to issue special regulations respecting licenses to sell it, &c., amounted to thirty-four, afterwards increasing to eighty) now amounts to 513. These stores are usually painted in gay colours outside; the wall behind the counter almost invariably exhibiting to view a rudely executed allegorical fresco setting forth the "Power of Love" under the stimulating effects of the maguey plant; Venus, Bacchus, and the nymphs occupying prominent positions in the back ground, whilst a little image of the Virgin with a lamp burning before it sometimes occupies a retired corner of the establishment.

The line of railway from the city of Mexico to Vera will pass through the great maguey plantations of the "Plains of Apam," and by the conveyance of pulque from thence at moderate rates the company reckon upon an annual receipt of about 250,000 dollars.

The best quality of the beverage is known under the different denominations of "pulque fino," "pulque dulce," or "pulque fuerte," whilst the inferior sort, the produce of the maguey when planted in an unfavourable soil, and which is commonly only consumed by the poorer class of Indians, by whom it is often manufactured in earthenware pots, is called "ilachique;" and there is another sort sold in the "pulquerias," composed of an admixture of this with some other sorts of a somewhat better description, denominated "pulque criollo," or "creole pulque." On account of the manufacture of "ilachique" being erroneously supposed to be carried on by the poor Indian population alone, it is subject to the payment of a very slight duty, and little is known of the real amount of its consumption.

From a chemical analysis of pulque it is found to contain, in different proportions according to its quality, alcohol, mucilaginous fecula, sugar, water, and potash. It has been observed that the drunkenness produced by it, under its different varieties, is of a less violent description than that produced by another common beverage of the country, "chinguirits" (brandy made from the sugar cane), and that *delirium tremens* is rarely produced by the immoderate use of the former, though often by that of the latter. It is also affirmed that the pulque drinker is commonly

long-lived, whilst the reverse is the case with regard to those addicted to "chinguirito," and that the former beverage, notwithstanding its somewhat acid taste, is, probably on account of the fecula contained in it, peculiarly beneficial to women suckling their infants, and to those people whose constitution requires a wholesome stimulant.

The earliest date at which a settled tax was levied on pulque was in the year 1668, under the Duke of Albuquerque, Viceroy at the time, who allowed the municipality of the city of Mexico to receive 1 real per arroba as gate dues upon its entrance. This impost was afterwards farmed out to various individuals, the first time at only 660 dollars per annum, but the rate rapidly increasing at different consecutive periods, in the year 1745 it was contracted for at the annual rate of 128,000 dollars, and that for nine years, the sale of it being subsequently administered by the Crown itself, and producing large amounts to the Treasury, as will be seen by the subjoined Tables.

The excesses committed by the lower orders during a riot occasioned by the high price of maize in the city of Mexico in the year 1692 being attributed to pulque drinking, the Count de Galvez, Viceroy at the time, consulted the Royal University, as well as the College of Jesuits, as to the expediency of prohibiting the use of it altogether, especially among the Indian population, and the Report upon the subject, which was issued by each of these learned bodies, is a most curious specimen of scholastic pedantry and monkish logic, the prohibition being finally determined upon. It was removed, however, within a short time afterwards, and the Crown of Spain allowed the sale of the popular beverage again under certain restrictions, incorporating the tax upon it with the other colonial imposts, in which in course of time it became a highly important item, producing in some years a sum of more than 1,000,000 dollars to the Treasury, During the few years which preceded the war of independence the annual amount of the pulque tax was from about 600,000 to 700,000 dollars; but in the year 1810 it fell to about 500,000 dollars; in the year 1811 to about 400,000 dollars; and from that time to the present it has continued falling until it has reached the present comparatively low average of about 200,000 dollars annually; the cause of so sensible a diminution being alone attributable to the extensive system of smuggling carried on, and to the increasing

					Dollars.

1864 to 1865	272,600
Grand total	43,400,088

In the above Tables the totals of the tax levied upon pulque from the year 1853 to 1865 are those to which the tax amounted in the City of Mexico alone, without reference to those of Puebla, Tlascala, Apam, Cuernabaca, Oaxaca, Queretaro, Toluca, Tulancingo, and many other towns, in which the beverage is consumed to an immense extent.

The collecting of the pulque tax in Mexico, before it was incorporated in the budget of all other Colonial taxes by the Spaniards, occupied a staff of employes, upon whom no other duty was imposed, there being a Superintendent, an Administrator, with a salary of 1,000 dollars each, with minor officials in all the towns where the beverage was drunk; the whole number of employes amounting to sixty-four, and their united salaries amounting to about 20,000 dollars.

During many years the tax imposed upon pulque was from about 1 to 1½ reals per arroba, the present tax being 10 cents per arroba, with an additional tax in Mexico to the municipality of 2 cents per arroba, the cost of collecting, which in the time of the Spaniards amounted to about 8 per cent., now amounting to rather more.

The spirit called mezcal, before alluded to, is made of the sap of the maguey plant, heated in a kind of oven, which is made in the ground, and which is of the simplest possible construction, and after fermentation has taken place it is passed through an alembic two or three times until it attains about 60 to 80 degrees of strength. It can be made from every description of the maguey plant; but the species the best adapted for its manufacture is that called the "chino," the "manso," and the "tenemetl." The consumption of this production of the maguey plant is trifling, however, when compared with that of pulque; and it was not until the year 1811 that the attention of the Mexican Government was so far directed to it as to impose a tax upon its sale, which tax was in the year 1821 amalgamated with that imposed upon sugar-cane brandy; and the spirit before alluded to called "chinguirito," the amount of which tax, whether in the aggregate or in detail, cannot be even approximatively ascertained. It is supposed, however, that the sale of mezcal alone is much about the same average as during the years which intervened between its first being taxed at all and the amalgamation of the impost levied upon it with that imposed upon the above-mentioned spirits. The following are the amounts of the tax during the years in question:—

Year.		Dolls.	rs.	Year.		Dolls.	rs.
1811	..	2,543	7	1818	..	5,624	0
1812	..	31,101	1	1819	..	9,794	6
1813	..	28,184	0	1820	..	11,194	2
1814	..	18,692	3	1821	..	8,659	0
1815	..	19,846	5				
1816	..	20,315	5				
1817	..	17,944	4				
				Grand total	..	173,900	1

The manufacture of this spirit, often erroneously termed a wine ("vino de mezcal"), is almost exclusively carried on in the States of Guadalajara and San Luis de Potosi. That manufactured in the former State, generally distinguished under the name of "tequila," from that being the name of the place where it is principally made, is very generally consumed throughout the country, but that manufactured in the latter is almost all sent to Guanajuato and Zacatecas, and is consumed by the mining labourers of those districts.

In the two first named States there are extensive districts covered with what is termed "maguey verde" or "green maguey," which, being of too poor a species to produce any but the worse quality of pulque, is turned to the manufacture of mezcal; and the plants which grow spontaneously are cut down at certain seasons and are never allowed to flower, which causes a greater proportion of sap to concentrate itself within the trunk.

In the year 1858, Don Fernando Pontones, the proprietor of a large estate on the plains of Apam, applied to the Mexican Government for the exclusive privilege of making sugar from the maguey plant, but was opposed by various persons, who asserted that such manufacture could not be termed a new branch of industry, which it was necessary it should be to enable the privilege to be legally granted, founding their assertion upon the very name of "agua-miel" or "honey-water," by which the juice of the plant was so commonly known, sufficiently denoting the possibility of extracting saccharine matter from it in large quantities. It might, however, perhaps with justice have been urged that although since the time of the letters of Ferdinand Cortes up to the publication of recent editions of botanical and scientific dictionaries, the fact of the maguey plant, in common with so many others containing saccharine matter, has ever been mentioned, still neither in the Mexican Empire nor in any of those districts of the Mediterranean where, I believe, the American agave has been to a certain degree acclimated, has any sugar from the plant been manufactured which could be compared with even the most inferior description of beet-root sugar, and that maguey sugar can scarcely therefore be asserted to have entered practically into the domain of science.

In consequence of the application of Señor Pontones, a Commission was named which caused various chemical experiments to be made, the results of which were con-

signed in the Reports presented by the Commission to the Government in the year 1858.

The following are the most important passages in the Report referred to:—

“As we have before said, in order that the manufacture of maguey sugar may be considered as a branch of industry, it is indispensable that such sugar should be previously assimilated to that of the cane, as far as mere external characteristics are concerned, since under such conditions alone could the speculation be entered into, as sugar such as the maguey plant produces, however really pure it might be, would be unsaleable in our markets in its primitive state; and besides its disagreeable appearance in comparison with that of the cane, it labours under the disadvantage that its saccharine force is less by 40 per cent. than that of the crystallized cane sugar, that is to say a proportion of $2\frac{1}{2}$ parts of the former are required in order to produce the same effect as 1 part of the latter.

“We are of opinion that the application should be granted, and we must add that although the samples of sugar presented by the interested parties clearly denoted, by their physical and organic characteristics that they belong to the same species as cane sugar, we submitted them to analyzation in Mr. Saleil’s “Saccharimetre,” which analyzation at once produced a result confirmatory of the identity of maguey with cane sugar.

“We may add the following statement of the proportional strength of the samples present by Señor Pontones to that of the white sugar of the Santa Inés estate.

“The numbers represent the proportion per cent. of sugar which is capable of crystalization.

“Loaf sugar from maguey	81·5
White, in powder (“migaja”), from maguey	81·5
Brown, in powder, from maguey	80·0
Cane sugar of Santa Inés estate	86·0”

In concluding their Report the Commission state their conviction that the great inferiority in strength of the maguey sugar which had been submitted to them to that of the cane, arose in some degree from the imperfect means employed in the manufacture of the former.

This would probably have been remedied had Señor Pontones commenced manufacturing maguey sugar upon a large scale by means of proper boilers and appliances; which he did not, no practical results whatever having ensued from the privilege having been granted to him.

At the time when he was taking such active steps to obtain it he exhibited in his house in the city of Mexico the following productions of the maguey spread out before a small specimen of the plant itself placed in a pot :—

Mezcal, of the finest description.

Brandy of 80 degrees in strength.

A substance resembling the best honey.

Concentrated gum fit for medicinal purposes.

A dark brown substance full of saccharine matter known in Mexico by the name of “piloncillo.”

Brown sugar, and of a lighter shade, in cakes, known in Mexico by the name of “panocha.”

Loaf sugar, whole and ground, both brown and white.

Sugar candy and crystallized sugar.

Vinegar of the best quality made from pulque, pulque itself being omitted by Señor Pontones amidst the various productions of the prolific maguey plant, as well as rope and sackcloth made from its fibre, probably from their being too common to excite any interest.

Henequen, sometimes termed “zenequen,” before alluded to in this as well as in a former Report, is a variety of the maguey which does not yield “agua-miel” but fibre alone, although belonging to the family of the American agave in all other characteristics, the cultivation of which in any large number is confined to the Peninsula of Yucatan, throughout the whole of which it is to be met with; although, as we have before seen, some of the varieties which are found in the valleys of Mexico and Puebla, and especially upon the plains of Apam, such as the Metometl and the Cosmetl Blanco, can be turned to the same use, as also a species of the agave called the Lechuguilla, to be met with upon the mountains in the vicinity of the town of Tula in the State of Tamaulipas, and some other places.

The leaves of this variety of the maguey plant are narrower, more supple, and of a darker green colour than most of those before alluded to, and are commonly tinged with pink at the edges; and there are four distinct species, the cheler and cajeu, which grow entirely wild, and the yaxqui and sacqui which are cultivated upon an extensive scale. The leaves of the yaxqui are of a more vivid green colour than those of the wild varieties of the plant, and their fibre is of a more elastic and finer quality; whilst that of the sacqui is of an inferior quality, but more abundant.

The first named variety of the plant is commonly known under the name of "henequen verde" or "green henequen," whilst the latter is called "henequen blanco" or "white henequen;" and constitutes the great agricultural wealth of the two districts of the Peninsula of Yucatan, called Zihosuco and Chemax, where it is the most generally cultivated, as the "Pulque Maguey" is upon the plains of Apam."

The "henequen maguey" is propagated in the same manner as the "pulque maguey," by means of transplantation, which is effected so soon as the offshoots or suckers are two years old; and at five years old they begin producing fibre, the leaves being cut off at stated periods. The plant can be cultivated in almost every kind of soil, but flourishes most in arid and stony places; and is, in every respect, as hardy as the Pulque Maguey; it throws out a similar stem, produces a similar flower, and usually attains fourteen or fifteen years of age. Although this particular species of the plant would appear to be an exclusive production of the Peninsula of Yucatan, it has still been found to thrive very well in the island of Cuba, and in the higher districts of the State of Orizaba.

As was before stated, the maguey fibre, under the name of "ixtli," and known in Yucatan by that of "josquil," was turned to various uses by the ancient inhabitants of the central provinces of the Mexican Empire, where it is still twisted into thread for shoemaking purposes, twine, thin ropes, "lazes," &c., and woven into sack cloth. The only part of the Mexican Empire, however, where this branch of industry is pursued upon any very extensive scale is Yucatan, producing very considerable commercial activity, as may be seen from my former Report, and especially since about the year 1840, when it was discovered in the United States that henequen cables possessed the great advantage over those of hemp of being more flexible and more serviceable in high latitudes; which discovery increased the demand for henequen to such a degree, as to cause it to rise in value from about 4 or 5 reals per arroba, the current price until then, to 11 reals, a price which it commanded during several years, the average price being now from about 7 to 8 reals; and the supply often not equalling the demand owing to the tedious nature of the process until then observed, of separating the fibre from the rest of the leaf by hand, a good workman not being able to clear more than 100 leaves per day. Great efforts were made

to cause machinery applicable to the purpose to be invented, rewards being offered both by private association of individuals and by the State for any machine which should prove to be efficacious ; henequen leaves being sent to the United States and to Great Britain to be operated upon, since a machine which had been invented and introduced into the country in 1833 by Mr. Perryne, an American, had been found to be useless, owing to neither the form of the combs nor their motion corresponding to the peculiar shape of the plant's leaves. No better success attended a machine introduced into the country by another American, Mr. Hitchcock, in 1847, nor that subsequently introduced by Mr. Thompson of Boston ; until, at last, Don José Maria Millet, a native of Mérida, the principal City of Yucatan, obtained an exclusive privilege from the Minister of Public Works for a machine of his invention, by means of which he was able to clear about six arrobas of fibre per day ; the services of only two men and two boys being necessary to work the levers by means of which the wheels and combs were set in motion. One of these machines has been brought to the city of Mexico to be applied to the extraction of the ixtle produced upon the plains of Apam, where so many of the leaves of the maguey are now wasted and left scattered about the plantations ; and which is destined greatly to increase in importance as an article of trade so soon as the Mexico and Vera Cruz Railway shall traverse that district. A machine for twisting ropes and cables was introduced in the year 1840 into the Peninsula of Yucatan, which is now able to compete with the United States in supplying the shipping of the island of Cuba, besides Mexican shipping itself with these articles.

Whilst, as we have before stated, the cultivation of henequen may be said to extend throughout the whole of Yucatan, there are 38 estates upon which it is exclusively produced ; and it is affirmed that the annual commercial movement, including the price of freights, transport, &c., connected with the production of this article in the Peninsula of Yucatan, involves a circulation of from 400,000 to 450,000 dollars annually.

Since sending in my former Report I have succeeded in obtaining some additional particulars respecting the growth of cotton upon the Pacific coast of the Mexican Empire. In point of quality, the cotton of the districts around the port of Acapulco, in the State of Guernero, stands foremost ; then that of the district of Santiago, in

the State of Nayarit; then that raised in the State of Sinaloa; and then that raised in the State of Colima; these four States alone producing cotton to any extent or of good quality upon the western coast of Mexico; whilst, as has been before stated, the quality of that produced in the State of Durango, bordering upon that of Sinaloa, and, although situated inland, in near proximity to the Pacific Ocean, is considered to be the finest in the empire.

The land sown with cotton in the year 1863, in the Acapulco districts, amounted to 30,000,000 square yards, upon which 6,100 fanegas (the measure called a "fanega" being equivalent to about an English bushel) of seed were expended; whilst in the year 1864, 41,000,000 square yards of land were devoted to the same purpose, the seed expended amounting to 8,100 fanegas; the crop of cotton in 1863 amounting to 75,000 quintals; whilst that of 1864, notwithstanding the larger extent of land sown and seed expended, did not attain more than about 30,000 quintals, owing to the wetness of the season, which generated the great scourge of the cotton districts in question—the worm in multitudes; much rain having fallen also, just as the pods were bursting, when dry weather is especially necessary.

In the Acapulco district the sowing of the cotton-seed takes place in the month of September or October, and annually, the plant becoming too much deteriorated the second year to be worth retaining; and the crop is gathered in in January or February.

The ginning-machines in use are partly moved by water-power and partly by mules, as are the presses for making up the bales, the latter being conveyed to the port itself upon mules at a cost of 7 reals per quintal per league, the coasting-vessels employed in the trade conveying cotton cargo at rates varying from 66 cents to 1 dollar 35 cents, according to distance. When the selling prices in Great Britain or the United States are over 30 cents per lb., by far the greater part of the crop is exported; but when the prices there do not reach that amount it is mostly conveyed into the interior of the country upon mules. An export duty of 2 dollars 50 cents per quintal upon all cotton leaving the country was imposed about three years ago by the Mexican Government, the exportation having been perfectly free before.

In normal times the price of cotton in the above districts, when purchased from the cotton-grower direct,

varied from about 3 cents to 4 cents per lb. in the pod; but during the last three years, when foreign prices increased so much, it has been sold in the pod as high as from 8 to 10 dollars per quintal; and to the same cause may be attributed the great increase of land sown.

Frequent shocks of earthquakes, which often cause the pods to fall off the stems, contribute to render the cultivation of the cotton-plant in the Acapulco districts a most precarious branch of agriculture; the following calculation depicting an almost incredible variation in the produce of the plantations. In very bad years the yield of cotton in the pod is about 3 quintals 70 cents for every fanega of seed sown; in tolerably favourable years, about 12 quintals 30 cents for each fanega; whilst in really abundant years, each fanega of seed sown yields about 36 quintals of cotton in the pod.

The crop this year in the Acapulco districts did not exceed 10,000 quintals of clean cotton, and may be considered as a failure, considering that 8,100 fanegas of seed were sown upon lands measuring, in the aggregate, 41,000,000 square yards.

The land sown with cotton in the year 1863 in the district of Santiago, in the State of Nayarit, amounted to 30 fanegas (the fanega, in measurement of land, consisting of 1,360 square yards), upon which 45 fanegas of seed were expended; whilst, in the year, 1864, 280 fanegas of land were sown, the seed expended amounting to 420 fanegas, the crop of cotton in 1863 amounting to 58,000 lbs., whilst that of 1864 amounted to 538,400 lbs.

In the Santiago district the sowing of the cotton seed takes place from the middle of August to the end of September; and the crop is gathered in from the middle of March to the middle of June. From the good results which have attended the introduction of the American plough, it is conjectured that it will shortly entirely supersede the rude implements hitherto in use for tilling the ground.

There are three cotton spinneries in the State of Nayarit, one at Santiago itself, and the other two in the neighbourhood of Tapia, a town about eighteen leagues from it, each containing a ginning machine, the raw material being conveyed thither by mules.

The chief impediment to the development of the branch of agricultural industry referred to in the district of Santiago, in common with most of the other cotton districts

of the Empire, is the scarcity of labourers, but which is most particularly felt in the former district, since the existence of the present state of civil warfare, to the ravages of which it has been constantly exposed, and which have resulted, not only in the ruin of most of the poorer class of agriculturists, but in a very considerable diminution of the population in general. Nevertheless, it was calculated, from the quantity of seed sown, that the cotton crop this year would be nearly three times more considerable than last year in the Santiago district, should greater tranquillity prevail, and no atmospherical changes of a hurtful character intervene; but we have been unable to learn how far such expectations have been realized.

The land devoted to the cultivation of cotton in the year 1863 in the districts of the State of Sinaloa, amounted to 1,300 acres, whilst, in the year 1864, 10,500 acres of land were devoted to the same purpose; my informant having been unable to inform me of the quantity of seed sown, the crop of cotton in 1863 amounting to 500,000 lbs., whilst that of 1864 amounted to 5,200,000 lbs.

In the districts referred to the sowing of the cotton seed takes place from June to September, and the crop is gathered in from January to May. As in the Santiago districts the American plough has been introduced with success, and has already greatly superseded the tools hitherto in use for breaking the soil; and 19 ginning-machines, with presses, 7 of which are worked by mules and 12 by steam, as well as 3 without presses worked by mules, have been erected, the raw material being conveyed by mules, at a cost of 22 cents per quintal per league.

We have not been able to ascertain the approximate amount of the cotton crop in Sinaloa this year, only about 400 lbs. per acre having been calculated upon from the appearance of the plants (which had suffered severely from the attacks of the worm) in those places where the labourers had not been carried away as soldiers by the rebel leaders who have so long ravaged this portion of the Mexican Empire, rendering any attempt to compile agricultural statistics abortive.

Until this year almost all the cotton produced in this particular district has been consumed at home; but during some months past a good deal has been exported; the first cargo, consisting of 26,500 lbs., having been shipped for New York, via San Francisco, in February last.

There are three manufactories of "mantas" (grey

domestics) in the State of Sinaloa, consuming, in the aggregate, about 1,000,000 lbs. of cotton; and those of the adjacent State of Zalisco consume about 5,000,000 lbs.

The extent of land devoted to the cultivation of cotton in the years 1863 and 1864 in the State of Colima, consisting of the districts around the city of the same name, and those of Sihuatlan and Coahuayana was as follows:—

					1863.	1864.
					Fanegas.	Fanegas.
Colima	440	225
Sihuatlan	150	300
					Caballerias.*	Caballerias.
Coahuayana	26	30

The quantity of seed sown being as follows:—

					1863.	1864.
					Arrobas.	Arrobas.
Colima	1,800	900
Sihuatlan	450	900
Coahuayana	1,600	2,000

The crop of cotton produced being as follows:—

					1863.	1864.
					Arrobas.	Arrobas.
Colima	5,000	3,000
Sihuatlan	12,000	4,000
Coahuayana	90,000	50,000

The total amount of the cotton crop in the State of Colima being thus—in 1863, 107,000 arrobas, and, in 1864, 57,000 arrobas.

In the districts referred to the sowing of the cotton seed takes place from about the 1st September to the 10th October, and the crop is gathered in from the beginning of March until the middle of May.

From about 36 to 60 arrobas of seed is about the quantity sown upon each caballeria of land, according to the soil and position, but, from the cheapness of the seed in the Coahuayana district, more than is necessary is generally expended.

The plough has not yet been introduced into the districts in question, except in the immediate vicinity of

* The caballeria is equal to 105½ acres.

the town of Colima itself, much the same rude implements for tilling the ground as those in use in the time of the Spanish occupation being still employed. Ginning machines have, however, been introduced, of which there are two, worked by steam, in the spinneries of the district of Coahuayana, whilst in that of Colima itself there are three (two being within the city itself) worked by water power, and two in that of Sihuatlan, each of these machines having packing presses attached to it.

The raw material is conveyed upon mules from one point to another; the rate of transport from the districts of Colima and Coahuayana to the port of Manzanillo is from 3 to 4 dollars the carga or load, varying from 12 to 14 arrobas, and the rate is about the same from Coahuayana to Colima.

The cotton produced in the district of Sihuatlan is almost all conveyed to the small port of La Naridad, being shipped from thence either to San Blas or Manzanilla for foreign consumption; the rates of freight by the American steamers, which touch regularly at the latter port, being $1\frac{1}{2}$ cents per lb. to Panamá; from Panamá to Liverpool, 9*l.* 10*s.* per ton; and from Manzanillo to New York, $4\frac{1}{2}$ cents per lb.

It is only within the last three years that any exportation of cotton has taken place from Colima, the quantity not consumed within the State itself having been before conveyed to spinneries in the interior of the country, the rate per carga or load, of from 12 to 14 arrobas, being 8 dollars to Guadalajara, 12 dollars to Morelia, and 14 to 15 dollars to Guanajuato.

The cotton crops of the districts of Colima, alike with those of Acapulco, suffered severely in 1863, and especially in 1864, from the attacks of the worm and from rain falling just at the moment when dry weather was most required.

From the foregoing information concerning the cultivation upon the low lands bordering the Pacific Coast of the Mexican Empire, it will be seen that the results obtained are of no very encouraging description. Besides the great evil of the insalubrity of several of the districts referred to, there is another even more generally felt, and that is the scarcity of labour, which naturally adds greatly to the cost of production, and hence the difficulty of extending the growth of so valuable a production, unless encouragement

be afforded by highly remunerative prices abroad. It has been lately a matter of serious discussion among such persons as have embarked their capital in the branch of agriculture referred to, as well in the cotton districts of the eastern as of the western coast of Mexico, whether the evils in question might not be obviated to some extent by the introduction of Chinese labour, but the conclusion usually arrived at is that, in the still unsettled state of the country, any undertaking of this description would be attended with but doubtful results, owing to the absence of any guarantee for the protection of life or property.

(Signed) R. F. C. MIDDLETON.

Inclosure 2.

Report on the Finances of Mexico.

Mexico, January 10, 1866.

As near as I have been able to ascertain, the following is an approximative estimate of the amount of the revenue and expenditure of the Mexican Empire to be calculated upon for the year 1866:—

REVENUE.

	Dollars.
Maritime Custom-houses	12,500,000
Internal Custom-houses	5,200,000
Direct taxes upon property in town and country ..	1,200,000
Ditto upon commercial and industrial establishments	250,000
Mining duties	650,000
Stamped paper, post office, and other miscellaneous taxes	1,000,000
Total	20,800,000

EXPENDITURE.

	Dollars.
Imperial House	1,740,000
Ministry of the Imperial House	30,000
" " State	340,000
" " Foreign Affairs	290,000
" " the Interior	3,700,000
" " Justice	900,000
" " Public Instruction	438,000
" " War	12,970,000
" " Public Works	1,626,000
" " Finance	3,400,000
Total	25,434,000

With reference to the proceeds of the Maritime Custom-houses, it may be observed that the foregoing Return is based upon the amount received during the twelve months from the 1st July, 1864, to the 30th June, 1865, and that the Custom-house of the Port of Vera Cruz alone produced during the year 1865 up to the 31st December, 5,213,531 dollars 53 cents ; consequently, if the proceeds of the other Maritime Custom-houses follow at all the same ratio, the revenue arising therefrom may be calculated at a larger amount than that stated, say from 1,000,000 to 2,000,000 dollars more.

The revenue stated as arising from the internal Custom-houses is based upon the same calculation as that arising from the maritime ; but as the amount collected by the Custom-house of the city of Mexico alone during the year 1865 was very near upon 3,000,000 dollars (a sum far greater than has been collected there for many years past), it is but reasonable to suppose that the proceeds of the internal alike with the maritime Custom-houses will produce a higher total than the one above stated.

With reference to the Table of Expenditure, it is worthy of remark that the estimate of expenses of the War Department, embracing the term of the fiscal year from July 1864 to June 1865, refers to the Mexican, Austrian, and Belgian troops alone, the cost of the French contingent not being included therein ; and this estimate will probably have to be greatly increased, owing to the little progress made in the pacification of the country.

The estimate of the Ministry of Public Works is almost daily on the increase, owing to the number of subventions granted to different railway companies and industrial enterprises ; the drainage of the immense lakes in the valley of Mexico, entailing according to a rough calculation an expenditure of from 3,000,000 to 4,000,000 dollars, is also in contemplation.

The estimate of the Ministry of Finance, like the preceding, must be also almost daily on the increase, owing to the constant creation of new fiscal offices throughout the whole empire ; and, in fact, with reference to almost all the other departments of the State, a considerable increase of expenditure may be anticipated.

PUBLIC DEBT.

	Dollars.	Dollars.
Interest and sinking-fund on British Convention	750,000	
Ditto, ditto, on Padre Moran Convention	150,000	
Ditto, ditto, on Spanish Convention .	450,000	
Interest and sinking-fund on the Internal Debt . . .	1,200,000	
The Government estimate of interest payable on the Mexican Stocks in London, including the Deferred Bonds, and on the amounts of the Miramar and Paris Loans, is calculated at	10,280,000	
		12,830,000
Unpaid balances on Laguna, Seca, and Guadalajara Conductas, estimated at		150,000
Sundry recognized claims		265,000
Subvention to Vera Cruz Railway		1,350,000
Total		14,595,000

The Laguna Seca claims for about 600,000 dollars, and the Zecker Bonds for 10,000,000 dollars, are to be paid off by drafts upon the Financial Committee in Paris, and as they will be recovered out of the proceeds of the late loans, they are excluded from these estimates.

The interest of the British Convention fund for the present year, 6 per cent. on 4,428,732 dollars 55 cents, is 241,723 dollars 95 cents.

The Sinking Fund of 6 per cent. on 4,984,914 dollars 84 cents is 299,494 dollars 89 cents, making a total of 541,818 dollars 84 cents; but as the action of the Sinking Fund is greatly in arrears, any surplus received over and above the 299,494 dollars 89 cents will have to be applied to the redemption of the Stock. It may be also observed that the quota of the import duties appropriated to the said Convention during the last year produced about 750,000 dollars, and it is calculated that it will produce at least as much during the present year.

The interest on the Padre Moran Convention for the present year, 6 per cent. on 825,720 dollars, is 49,543 dollars 20 cents.

The Sinking Fund, 6 per cent. on 983,000 dollars, is 59,980 dollars, making a total of 109,523 dollars 20 cents.

But the action of the Sinking Fund is, alike with that of the British Convention, greatly in arrears, and thus, in the same way, any surplus received over and above the

59,980 dollars will have to be applied to the redemption of the said stock; and as the quota of the import duties during the last year produced about 150,000 dollars, at least as much is calculated upon for the present year.

The interest upon the Spanish Convention is 3 per cent. on about 7,000,000 dollars (say 210,000 dollars); but, as the interest as well as the Sinking Fund are both greatly in arrears, whatever surplus the quota of the duties which the Convention in question has appropriated to it may produce will have to be applied, firstly, to arrears of interest, and afterwards to the Sinking Fund; and, as during the past year the said quota produced about 450,000 dollars, it is expected during the current year to produce a similar amount.

The liquidation of the balances of the Laguna Seca and Guadalajara Conductas claim is in contemplation.

With regard to the interest and Sinking Fund on the Internal Debt, within the last few weeks an arrangement has been entered into between the stockholders and the Imperial Government for 100,000 dollars in cash, to be destined, monthly, for the purchase of the said stock at public auction at the rate of 25 per cent. maximum value; and as up to the 31st December last about 93,418,219 dollars were liquidated, it is calculated, if the arrangement is carried out on the part of the Government, that the whole debt will be cancelled in the course of five or six years, as the majority of the holders will be willing to cancel their stock at a much lower rate than the maximum fixed. If, however, it (the arrangement) should not be carried out, the item of 1,200,000 dollars mentioned in the foregoing Table of the Public Debt would go to reduce the deficit in the Budget.

According to the foregoing statements the revenue and expenditure would be thus:—

	Dollars.	Dollars.
Total revenue		20,800,000
Imperial House and the different Departments of State ..	25,434,000	
Interest, &c., on public debt ..	14,595,000	
	<hr/>	<hr/>
		40,029,000
Total deficit		<hr/>
		19,229,000

It was proposed to cover this deficit out of the proceeds of the late loans, but a very large portion of them has been absorbed by other liabilities and disbursements.

It is worthy of remark here, that although in the official estimate of interest on the public debt the item

of 10,280,000 dollars appears, yet as part of the interest on the said debt is provided for by sums left in deposit in the hands of the Financial Commission in Paris, only about 7,109,500 dollars will have to be disbursed, as it were, from the actual revenue of the present year, as per Annex No. 2 (Annex No. 1 being a copy of the Paris Balance Sheet of the foreign debt), independent of the payments of France, stipulated in the Miramar Convention.

The value of property now belonging to private individuals but formerly Church property, the titles to which have been revised and sanctioned by the Imperial Council of State, amounted during the past year to about 40,000,000 dollars.

The value of the exportations from France into the Mexican Empire during the year 1864 amounted to 70,687,426 francs, whilst the value of the importations from the Mexican Empire into France during the same period, amounted to 6,110,891 francs.

The principal articles of exportation from France into the Mexican Empire consist of wines, wearing apparel, lace and embroideries, haberdashery, paper, glass, jewellery, and liqueurs; whilst those imported into France from the Mexican Empire consist of ornamental woods, cotton, cochineal, hides, mother of pearl, copper, vanilla, jalap, and sarsaparilla.

The exportations from France into the Mexican Empire during the last six years have been considerably on the increase, as may be seen by the following Tables; the very remarkable increase during the years 1863 and 1864 being attributable to the permanent occupation of the country by the French, and the establishment of the Empire.

Francs.			Francs.		
1859	17,300,000	1862 20,500,000
1860	17,400,000	1863 22,200,000
1861	17,700,000	1864 70,687,427

From the following imperfect statement of the amount of the exportations from the Mexican Empire to France, it appears, however, that they have by no means increased in equal proportion, nor, indeed, could they do so; for whilst the wants of the French army and of the numerous foreigners who followed in the wake to Mexico naturally increased the demand for foreign articles of luxury as well as of necessity, to a vast extent, as may be seen above; no analogous causes exist to produce any parallel increase in the amount of the exportations from the Empire.

During the years 1859 to 1861 the amount of exportations from the Mexican Empire into France did not attain more than from about 4,000,000 to 5,000,000 francs per annum ; but in the year 1864 they attained, as was before stated, the sum of 6,110,891 francs ; and it is reasonable to suppose as colonization progresses, internal means of communication are established, and the resources of the country become more fully developed, that the export trade, as well as all other branches of national industry, will still further improve.
